[6966] Another function of VGAM42 is therefore inhibition of LOC150622 (Accession XM_086960). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150622. LOC152925 (Accession XM_087559) is another VGAM42 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39330, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:2753.

[6967] Another function of VGAM42 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities

of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC205355 (Accession XM_119694) is another VGAM42 host target gene. LOC205355 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC205355, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC205355 BINDING SITE, designated SEQ ID:43596, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:2753.

[6968] Another function of VGAM42 is therefore inhibition of LOC205355 (Accession XM_119694). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC205355. LOC220766 (Accession XM_165471) is another VGAM42 host target gene. LOC220766 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC220766, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC220766 BINDING SITE, designated SEQ ID:43648, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:2753.

[6969] Another function of VGAM42 is therefore inhibition of LOC220766 (Accession XM_165471). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220766. LOC92270 (Accession XM_043989) is another VGAM42 host target gene. LOC92270 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92270, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92270 BINDING SITE, designated SEQ ID:34062, to the nucleotide sequence of VGAM42 RNA, herein designated VGAM RNA, also designated SEQ ID:2753.

[6970] Another function of VGAM42 is therefore inhibition of LOC92270 (Accession XM_043989). Accordingly, utilities of VGAM42 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92270. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 43 (VGAM43) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6971] VGAM43 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM43 was detected is described hereinabove with reference to Figs. 1–8.

[6972] VGAM43 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6973] VGAM43 gene encodes a VGAM43 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM43 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM43 precursor RNA is designated SEQ ID:29, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:29 is located at position 189040 relative to the genome of In-

vertebrate Iridescent Virus 6.

[6974] VGAM43 precursor RNA folds onto itself, forming VGAM43 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6975] An enzyme complex designated DICER COMPLEX, `dices` the VGAM43 folded precursor RNA into VGAM43 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM43 RNA is designated SEQ ID:2754, and is provided hereinbelow with reference to the sequence listing part.

[6976] VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM43 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[6977] VGAM43 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM43 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM43 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[6978] The complementary binding of VGAM43 RNA, herein designated VGAM RNA, to host target binding sites on VGAM43 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM43 host target RNA into VGAM43 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[6979] It is appreciated that VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM43 host target genes. The mRNA of each one of this plurality of VGAM43 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM43 RNA, herein designated VGAM RNA, and which when bound by VGAM43 RNA causes inhibition of translation of respective one or more VGAM43 host target proteins.

[6980] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM43 gene, herein designated VGAM GENE, on one or more VGAM43 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[6981] It is yet further appreciated that a function of VGAM43 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM43 correlate with, and may be deduced from, the identity of the host target genes which VGAM43 binds and inhibits,

and the function of these host target genes, as elaborated hereinbelow.

[6982] Nucleotide sequences of the VGAM43 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM43 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM43 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM43 are further described hereinbelow with reference to Table 1.

[6983] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM43 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM43 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[6984] As mentioned hereinabove with reference to Fig. 1, a function of VGAM43 gene, herein designated VGAM is inhibition of expression of VGAM43 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM43 correlate with, and may be deduced from, the identity of the target genes which VGAM43 binds and inhibits, and the function of these target genes, as elabo-

rated hereinbelow.

[6985] Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410) is a VGAM43 host target gene. MGAT5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGAT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT5 BINDING SITE, designated SEQ ID:8237, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:2754.

[6986] A function of VGAM43 is therefore inhibition of Mannosyl (alpha-1,6-)-glycoprotein Beta-1,6-N-acetyl-glucosaminyltransferase (MGAT5, Accession NM_002410). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT5. Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406) is another VGAM43 host target gene. YWHAZ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YWHAZ, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YWHAZ BINDING SITE, designated SEQ ID:9443, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:2754.

[6987] Another function of VGAM43 is therefore inhibition of Tyrosine 3-monooxygenase/tryptophan 5-monooxygenase Activation Protein, Zeta Polypeptide (YWHAZ, Accession NM_003406), a gene which mediates signal transduction by binding to phosphorylated serine residues on a variety of signaling molecules. Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YWHAZ. The function of YWHAZ has been established by previous studies. The binding of insulin (OMIM Ref. No. 176730) to its receptor induces the phosphorylation of the cytosolic substrates IRS1 (OMIM Ref. No. 147545) and IRS2 (OMIM Ref. No. 600797), which associate with several Src homology-2 (SH2) domain-containing proteins. To identify unique IRS1-binding proteins, Ogihara et al. (1997) screened a human heart cDNA expression library with recombinant IRS1. They obtained 2 isoforms of the 14-3-3 protein

family, 14-3-3-zeta and -epsilon (YWHAE; 605066).

14-3-3 protein has been shown to associate with IRS1 in L6 myotubes, HepG2 hepatoma cells, Chinese hamster ovary cells, and bovine brain tissue. The amount of 14-3-3 protein associated with IRS1 was not affected by insulin stimulation but was increased significantly by treatment with okadaic acid, a potent serine/threonine phosphatase inhibitor. The authors identified a putative 14-3-3 protein-binding site within the phosphotyrosine-binding (PTB) domain of IRS1. Ogiwara et al. (1997) suggested that the association with 14-3-3 protein may play a role in the regulation of insulin sensitivity by interrupting the association between the insulin receptor and IRS1. Using in vitro pull-down assays, Powell et al. (2002) showed that recombinant 14-3-3-zeta interacted directly with both recombinant and endogenous protein kinase B (PKB, or AKT1; 164730) within embryonic kidney cell lysates. They found that recombinant PKB phosphorylated 14-3-3-zeta in an in vitro kinase assay, and transfection of active PKB into embryonic kidney cells resulted in phosphorylation of 14-3-3-zeta. By mutation analysis, Powell et al. (2002) determined that the phosphate acceptor was serine-58. They also showed that phosphorylation did not result in

14-3-3-zeta dimerization.

[6988] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[6989] Ogihara, T.; Isobe, T.; Ichimura, T.; Taoka, M.; Funaki, M.; Sakoda, H.; Onishi, Y.; Inukai, K.; Anai, M.; Fukushima, Y.; Kikuchi, M.; Yazaki, Y.; Oka, Y.; Asano, T. : 14-3-3 protein binds to insulin receptor substrate-1, one of the binding sites of which is in the phosphotyrosine binding domain. J. Biol. Chem. 272: 25267-25274, 1997. ; and

[6990] Powell, D. W.; Rane, M. J.; Chen, Q.; Singh, S.; McLeish, K. R. : Identification of 14-3-3-zeta as a protein kinase B/ Akt substrate. J. Biol. Chem. 277: 21639-21642, 2002.

[6991] Further studies establishing the function and utilities of YWHAZ are found in John Hopkins OMIM database record ID 601288, and in cited publications numbered 6379-6380, 4469, 1122 and 4192 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM_045261) is another VGAM43 host target gene. LRRN3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LRRN3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRN3 BINDING SITE, designated SEQ ID:34399, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:2754.

[6992] Another function of VGAM43 is therefore inhibition of Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM_045261). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN3. SCDGF-B (Accession NM_025208) is another VGAM43 host target gene. SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by SCDGF-B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCDGF-B BINDING SITE1 and SCDGF-B BINDING SITE2, designated SEQ ID:24881 and SEQ ID:26983 respectively, to the nucleotide sequence of VGAM43 RNA, herein designated VGAM RNA, also designated SEQ ID:2754.

[6993] Another function of VGAM43 is therefore inhibition of

SCDGF-B (Accession NM_025208). Accordingly, utilities of VGAM43 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCDGF-B. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 44 (VGAM44) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[6994] VGAM44 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM44 was detected is described hereinabove with reference to Figs. 1-8.

[6995] VGAM44 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[6996] VGAM44 gene encodes a VGAM44 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM44 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se-

quence of VGAM44 precursor RNA is designated SEQ ID:30, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:30 is located at position 117574 relative to the genome of Invertebrate Iridescent Virus 6.

[6997] VGAM44 precursor RNA folds onto itself, forming VGAM44 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[6998] An enzyme complex designated DICER COMPLEX, `dices` the VGAM44 folded precursor RNA into VGAM44 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM44 RNA is designated SEQ ID:2755, and is

provided hereinbelow with reference to the sequence listing part.

[6999] VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM44 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7000] VGAM44 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM44 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM44 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7001] The complementary binding of VGAM44 RNA, herein designated VGAM RNA, to host target binding sites on VGAM44 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM44 host target RNA into VGAM44 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7002] It is appreciated that VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM44 host target genes. The mRNA of each one of this plurality of VGAM44 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM44 RNA, herein designated VGAM

RNA, and which when bound by VGAM44 RNA causes inhibition of translation of respective one or more VGAM44 host target proteins.

[7003] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM44 gene, herein designated VGAM GENE, on one or more VGAM44 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7004] It is yet further appreciated that a function of VGAM44 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM44 include diagnosis, prevention and

treatment of viral infection by Invertebrate Iridescent Virus

6. Specific functions, and accordingly utilities, of VGAM44 correlate with, and may be deduced from, the identity of the host target genes which VGAM44 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7005] Nucleotide sequences of the VGAM44 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM44 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM44 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM44 are further described hereinbelow with reference to Table 1.

[7006] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM44 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM44 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7007] As mentioned hereinabove with reference to Fig. 1, a function of VGAM44 gene, herein designated VGAM is inhibition of expression of VGAM44 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM44 correlate with, and may be deduced from, the identity of the target genes which VGAM44 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7008] LOC132671 (Accession NM_145263) is a VGAM44 host target gene. LOC132671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC132671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC132671 BINDING SITE, designated SEQ ID:29778, to the nucleotide sequence of VGAM44 RNA, herein designated VGAM RNA, also designated SEQ ID:2755.

[7009] A function of VGAM44 is therefore inhibition of LOC132671 (Accession NM_145263). Accordingly, utilities of VGAM44 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC132671. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 45 (VGAM45) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7010] VGAM45 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM45 was detected is described hereinabove with reference to Figs. 1–8.

[7011] VGAM45 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7012] VGAM45 gene encodes a VGAM45 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM45 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM45 precursor RNA is designated SEQ ID:31, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:31 is located at position 169711 relative to the genome of Invertebrate Iridescent Virus 6.

[7013] VGAM45 precursor RNA folds onto itself, forming VGAM45

folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7014] An enzyme complex designated DICER COMPLEX, `dices` the VGAM45 folded precursor RNA into VGAM45 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM45 RNA is designated SEQ ID:2756, and is provided hereinbelow with reference to the sequence listing part.

[7015] VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM45 host target RNA comprises three

regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7016] VGAM45 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM45 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM45 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target bind-

ing sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7017] The complementary binding of VGAM45 RNA, herein designated VGAM RNA, to host target binding sites on VGAM45 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM45 host target RNA into VGAM45 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7018] It is appreciated that VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM45 host target genes. The mRNA of each one of this plurality of VGAM45 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM45 RNA, herein designated VGAM RNA, and which when bound by VGAM45 RNA causes inhibition of translation of respective one or more VGAM45 host target proteins.

[7019] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM45 gene, herein designated VGAM GENE, on one or more VGAM45 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7020] It is yet further appreciated that a function of VGAM45 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM45 correlate with, and may be deduced from, the identity of the host target genes which VGAM45 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7021] Nucleotide sequences of the VGAM45 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM45 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM45 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM45 are further described hereinbelow with reference to Table 1.

[7022] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM45 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM45 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7023] As mentioned hereinabove with reference to Fig. 1, a function of VGAM45 gene, herein designated VGAM is inhibition of expression of VGAM45 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM45 correlate with, and may be deduced from, the identity of the target genes which VGAM45 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7024] Guanine Nucleotide Binding Protein (G protein), Alpha In-

hibiting Activity Polypeptide 3 (GNAI3, Accession NM_006496) is a VGAM45 host target gene. GNAI3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI3 BINDING SITE, designated SEQ ID:13237, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7025] A function of VGAM45 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 3 (GNAI3, Accession NM_006496), a gene which stimulates receptor regulated K⁺-channels. Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI3. The function of GNAI3 has been established by previous studies. Using a cDNA probe against a mouse/human somatic cell hybrid panel, Sparkes et al. (1987) mapped the alpha inhibiting polypeptide-3 of G protein to chromosome 1. See also Blatt et al. (1988). Alpha-3 cDNA codes for a protein of 340 amino acids (relative molecular weight 40,522), of

which the sequence is closely related to but distinct from that of alpha-2 (Itoh et al., 1988). By in situ hybridization, Wilkie et al. (1992) assigned the gene to 1p13. They assigned the corresponding gene to mouse chromosome 3 by study of restriction fragment length variation in an interspecific backcross. Baron et al. (1994) demonstrated that the Gnai3 gene in the hamster is less than 60 kb from the Ampd2 gene (OMIM Ref. No. 102771) with which it is coamplified in coformycin-resistant cells. The hamster Gnai3 gene did not contain sequences corresponding to the combined U6 snRNA and E protein pseudogene, previously identified within intron 7 of the human gene.

[7026] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7027] Baron, B.; Fernandez, M. A.; Toledo, F.; Le Roscouet, D.; Mayau, V.; Martin, N.; Buttin, G.; Debatisse, M. : The highly conserved Chinese hamster GNAI3 gene maps less than 60 kb from the AMPD2 gene and lacks the intronic U6 snRNA present in its human counterpart. Genomics 24: 288-294, 1994. ; and

[7028] Sparkes, R. S.; Cohn, V. H.; Mohandas, T.; Zollman, S.; Cire-Eversole, P.; Amatruda, T. T.; Reed, R. R.; Lochrie, M.

A.; Simon, M. I. : Mapping of genes encoding the subunits of guanine.

[7029] Further studies establishing the function and utilities of GNAI3 are found in John Hopkins OMIM database record ID 139370, and in cited publications numbered 3182, 474 and 2186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274) is another VGAM45 host target gene. AKAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP6 BINDING SITE, designated SEQ ID:10490, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7030] Another function of VGAM45 is therefore inhibition of A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKAP6. ARGBP2 (Accession NM_003603) is another VGAM45 host target gene.

ARGBP2 BINDING SITE1 and ARGBP2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ARGBP2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARGBP2 BINDING SITE1 and ARGBP2 BINDING SITE2, designated SEQ ID:9658 and SEQ ID:22042 respectively, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7031] Another function of VGAM45 is therefore inhibition of ARGBP2 (Accession NM_003603). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARGBP2. FLJ20666 (Accession NM_017922) is another VGAM45 host target gene. FLJ20666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20666 BINDING SITE, designated SEQ ID:19580, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2756.

[7032] Another function of VGAM45 is therefore inhibition of FLJ20666 (Accession NM_017922). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20666. HMT1 HnRNP Methyltransferase-like 3 (*S. cerevisiae*) (HRMT1L3, Accession NM_019854) is another VGAM45 host target gene. HRMT1L3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HRMT1L3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRMT1L3 BINDING SITE, designated SEQ ID:21259, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7033] Another function of VGAM45 is therefore inhibition of HMT1 HnRNP Methyltransferase-like 3 (*S. cerevisiae*) (HRMT1L3, Accession NM_019854). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRMT1L3. KIAA0373 (Accession NM_014684) is another VGAM45 host target gene. KIAA0373 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0373 BINDING SITE, designated SEQ ID:16185, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7034] Another function of VGAM45 is therefore inhibition of KIAA0373 (Accession NM_014684). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0373. Zinc Finger RNA Binding Protein (ZFR, Accession NM_016107) is another VGAM45 host target gene. ZFR BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZFR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFR BINDING SITE, designated SEQ ID:18186, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7035] Another function of VGAM45 is therefore inhibition of Zinc

Finger RNA Binding Protein (ZFR, Accession NM_016107). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFR. LOC221271 (Accession XM_166307) is another VGAM45 host target gene. LOC221271 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221271 BINDING SITE, designated SEQ ID:44122, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7036] Another function of VGAM45 is therefore inhibition of LOC221271 (Accession XM_166307). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221271. LOC221876 (Accession XM_168220) is another VGAM45 host target gene. LOC221876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC221876 BINDING SITE, designated SEQ ID:45079, to the nucleotide sequence of VGAM45 RNA, herein designated VGAM RNA, also designated SEQ ID:2756.

[7037] Another function of VGAM45 is therefore inhibition of LOC221876 (Accession XM_168220). Accordingly, utilities of VGAM45 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221876. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 46 (VGAM46) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7038] VGAM46 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM46 was detected is described hereinabove with reference to Figs. 1–8.

[7039] VGAM46 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[7040] VGAM46 gene encodes a VGAM46 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM46 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM46 precursor RNA is designated SEQ ID:32, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:32 is located at position 190087 relative to the genome of Invertebrate Iridescent Virus 6.

[7041] VGAM46 precursor RNA folds onto itself, forming VGAM46 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7042] An enzyme complex designated DICER COMPLEX, `dices` the VGAM46 folded precursor RNA into VGAM46 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM46 RNA is designated SEQ ID:2757, and is provided hereinbelow with reference to the sequence listing part.

[7043] VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM46 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7044] VGAM46 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM46 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM46 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7045] The complementary binding of VGAM46 RNA, herein designated VGAM RNA, to host target binding sites on VGAM46 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM46 host target RNA into VGAM46 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7046] It is appreciated that VGAM46 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM46 host target genes. The mRNA of each one of this plurality of VGAM46 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM46 RNA, herein designated VGAM RNA, and which when bound by VGAM46 RNA causes inhibition of translation of respective one or more VGAM46 host target proteins.

[7047] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM46 gene, herein designated VGAM GENE, on one or more VGAM46 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7048] It is yet further appreciated that a function of VGAM46 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM46 correlate with, and may be deduced from, the identity of the host target genes which VGAM46 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7049] Nucleotide sequences of the VGAM46 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM46 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM46 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM46 are further described hereinbelow with reference to Table 1.

[7050] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM46 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM46 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7051] As mentioned hereinabove with reference to Fig. 1, a function of VGAM46 gene, herein designated VGAM is inhibition of expression of VGAM46 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM46 correlate with, and may be deduced from, the identity of the target genes which VGAM46 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7052] COX15 Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376) is a VGAM46 host target gene. COX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COX15 BINDING SITE, designated SEQ ID:10600, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7053] A function of VGAM46 is therefore inhibition of COX15

Homolog, Cytochrome C Oxidase Assembly Protein (yeast) (COX15, Accession NM_004376). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COX15. Chemokine (C-X-C motif) Ligand 6 (granulocyte chemo-tactic protein 2) (CXCL6, Accession NM_002993) is another VGAM46 host target gene. CXCL6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CXCL6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CXCL6 BINDING SITE, designated SEQ ID:8884, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7054] Another function of VGAM46 is therefore inhibition of Chemokine (C-X-C motif) Ligand 6 (granulocyte chemo-tactic protein 2) (CXCL6, Accession NM_002993), a gene which is chemotactic for neutrophil granulocytes. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CXCL6. The function of CXCL6 has been established by previous studies. Rovai et al. (1997) cloned the

human GCP2 gene, as well as epithelial cell-derived neutrophil-activating peptide-78 (ENA78, or SCYB5; 600324). Both coding and noncoding portions of the GCP2 gene share very high nucleotide similarity to ENA78, except for the occurrence of a long interspersed sequence 5-prime of the GCP2 gene. The GCP2 gene encodes a propeptide of 114 amino acids. Despite 85% identity of the first 270 nucleotides 5-prime of the transcription start sites, GCP2 and the other CXC chemokine gene ENA78 showed cell-specific differences in regulation. Wuyts et al. (1997) synthesized and purified a human GCP2 protein of 75 amino acids. In vitro, synthetic GCP2 was an equally active chemoattractant for neutrophilic granulocytes as was natural 75-amino acid GCP2. Synthetic GCP2 did not stimulate eosinophil, monocyte, or lymphocyte chemotaxis. The authors showed that GCP2 binds to the chemokine receptors CXCR1 and CXCR2. In vivo studies in rabbit demonstrated that GCP2 is a potent inflammatory mediator.

[7055] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7056] Rovai, L. E.; Herschman, H. R.; Smith, J. B. : Cloning and characterization of the human granulocyte chemotactic

protein-2 gene. J. Immun. 158: 5257-5266, 1997. ; and

[7057] Wuyts, A.; van Osselaer, N.; Haelens, A.; Samson, I.; Herdewijn, P.; Ben-Baruch, A.; Oppenheim, J. J.; Proost, P.; van Damme, J. : Characterization of synthetic human granulocyte chemot.

[7058] Further studies establishing the function and utilities of CXCL6 are found in John Hopkins OMIM database record ID 138965, and in cited publications numbered 16 and 11961-165 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ephrin-B2 (EFNB2, Accession NM_004093) is another VGAM46 host target gene. EFNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EFNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EFNB2 BINDING SITE, designated SEQ ID:10298, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7059] Another function of VGAM46 is therefore inhibition of Ephrin-B2 (EFNB2, Accession NM_004093). Accordingly, utilities of VGAM46 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with EFNB2. Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Accession NM_002053) is another VGAM46 host target gene. GBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBP1 BINDING SITE, designated SEQ ID:7810, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7060] Another function of VGAM46 is therefore inhibition of Guanylate Binding Protein 1, Interferon-inducible, 67kDa (GBP1, Accession NM_002053), a gene which specifically binds guanylate nucleotides (GMP, GDP and GTP). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBP1. The function of GBP1 has been established by previous studies. Interferons are cytokines that have antiviral effects and inhibit tumor cell proliferation. They induce a large number of genes in their target cells, including those coding for the guanylate-binding proteins

(GBPs). GBPs are characterized by their ability to specifically bind guanine nucleotides (GMP, GDP, and GTP) and are distinguished from the GTP-binding proteins by the presence of 2 binding motifs rather than 3. Cheng et al. (1991) cloned the cDNAs for GBP1 (a 67-kD protein) and GBP2 (partial cDNA; 600412). Strehlow et al. (1994) identified the human GBP1 gene and showed that it contains 11 exons. By use of somatic cell hybrid DNAs, they mapped the gene to human chromosome 1. A mouse homolog of GBP1 has been mapped to the distal region of mouse chromosome 3 (Prochazka et al., 1985). Strehlow et al. (1994) also identified and partially characterized a third novel member of the family (GBP3; 600413) which shows significant sequence similarity to both GBP1 and GBP2. The putative window of embryo implantation in the human opens between days 19 to 24 of the menstrual cycle. A major challenge in the study of human reproduction is to identify the molecular signals that participate in the establishment of this critical receptive phase in the context of the natural cycle. Toward this goal, Kumar et al. (2001) analyzed human endometrial biopsies at various days of the menstrual cycle by mRNA differential display. They isolated several cDNAs representing genes that are

either up- or downregulated within the putative window of implantation. They identified one of these genes as GBP1, which possesses GTPase activity. Analysis of endometrial biopsies by Northern blot and RT-PCR demonstrated that GBP1 mRNA is specifically induced at the mid-secretory phase of the menstrual cycle. In situ hybridization analysis revealed that GBP1 mRNA expression is localized in the glandular epithelial cells as well as in the stroma in the immediate vicinity of the glands. The authors concluded that its unique expression overlapping the putative window of implantation suggests that GBP1 may serve as a useful marker of uterine receptivity in the human.

[7061] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7062] Cheng, Y.-S. E.; Patterson, C. E.; Staeheli, P. : Interferon-induced guanylate-binding proteins lack an N(T)KXD consensus motif and bind GMP in addition to GDP and GTP. *Molec. Cell. Biol.* 11: 4717-4725, 1991. ; and

[7063] Kumar, S.; Li, Q.; Dua, A.; Ying, Y.-K.; Bagchi, M. K.; Bagchi, I. C. : Messenger ribonucleic acid encoding interferon-inducible guanylate binding protein 1 is induced in

human endometri.

[7064] Further studies establishing the function and utilities of GBP1 are found in John Hopkins OMIM database record ID 600411, and in cited publications numbered 9865–9868 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587) is another VGAM46 host target gene. MEF2A BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MEF2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEF2A BINDING SITE, designated SEQ ID:12119, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7065] Another function of VGAM46 is therefore inhibition of MADS Box Transcription Enhancer Factor 2, Polypeptide A (myocyte enhancer factor 2A) (MEF2A, Accession NM_005587), a gene which binds a consensus sequence that regulates transcription. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with MEF2A. The function of MEF2A has been established by previous studies. The process of differentiation from mesodermal precursor cells to myoblasts has led to the discovery of a variety of tissue-specific factors that regulate muscle gene expression. The myogenic basic helix-loop-helix proteins, including myoD (OMIM Ref. No. 159970), myogenin (OMIM Ref. No. 159980), MYF5 (OMIM Ref. No. 159990), and MRF4 (OMIM Ref. No. 159991) are 1 class of identified factors. A second family of DNA binding regulatory proteins is the myocyte-specific enhancer factor-2 (MEF2) family. Each of these proteins binds to the MEF2 target DNA sequence present in the regulatory regions of many, if not all, muscle-specific genes. The MEF2 genes are members of the MADS gene family (named for the yeast mating type-specific transcription factor MCM1, the plant homeotic genes 'agamous' and 'deficiens' and the human serum response factor SRF (OMIM Ref. No. 600589)), a family that also includes several homeotic genes and other transcription factors, all of which share a conserved DNA-binding domain. Pollock and Treisman (1991) cloned a cDNA for MEF2A, which they designated as a member of the RSRF (related to serum response fac-

tor) family. They also described the protein's DNA binding properties and its potential role in regulation of growth factor-inducible and muscle specific sequences. MEF2A cDNAs were also obtained by Yu et al. (1992), who screened an expression library of primary human skeletal myocytes from vastus lateralis with a DNA probe containing multiple copies of the MEF2 binding sequence. The mRNA is ubiquitously expressed, with highest levels found in skeletal muscle, heart, and brain. Several alternative splice variants of MEF2A were identified that were predicted to encode different protein products. Using immunofluorescence, MEF2A protein was detected in the nuclei of skeletal and cardiac muscle cells. Hobson et al. (1995) mapped the MEF2A gene using somatic cell hybrid panel DNAs including deletion or derivative chromosome cell lines and regionalized it to 15q26 by fluorescence in situ hybridization (FISH) with a YAC shown to contain MEF2A. Mouse Mef2A was mapped by Martin et al. (1994) to chromosome 7. Suzuki et al. (1996) mapped the MEF2A gene to 15q26 by FISH. They isolated and mapped a partially processed pseudogene (OMIM Ref. No. MEF2AP) to 1q24-q25 by FISH. Animal model experiments lend further support to the function of MEF2A. Naya et al. (2002)

generated mice deficient in Mef2a, the predominant Mef2 gene expressed in postnatal cardiac muscle. Most mice lacking Mef2a died suddenly within the first week of life and exhibited pronounced dilation of the right ventricle, myofibrillar fragmentation, mitochondrial disorganization, and activation of a fetal cardiac gene program. The few Mef2a null mice that survived to adulthood also showed a deficiency of cardiac mitochondria and susceptibility to sudden death.

[7066] It is appreciated that the abovementioned animal model for MEF2A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7067] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7068] Pollock, R.; Treisman, R. : Human SRF-related proteins: DNA-binding properties and potential regulatory targets. *Genes Dev.* 5: 2327-2341, 1991. ; and

[7069] Suzuki, E.; Lowry, J.; Sonoda, G.; Testa, J. R.; Walsh, K. : Structures and chromosome locations of the human MEF2A gene and a pseudogene MEF2AP. *Cytogenet. Cell Genet.* 73: 244-249, 1996.

[7070] Further studies establishing the function and utilities of MEF2A are found in John Hopkins OMIM database record ID 600660, and in cited publications numbered 8293–8301 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM_002709) is another VGAM46 host target gene. PPP1CB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PPP1CB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1CB BINDING SITE, designated SEQ ID:8559, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7071] Another function of VGAM46 is therefore inhibition of Protein Phosphatase 1, Catalytic Subunit, Beta Isoform (PPP1CB, Accession NM_002709), a gene which is the catalytic subunit of protein phosphatase 1. Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1CB. The function of PPP1CB has been established by

previous studies. Protein phosphatase 1 (PP1) is one of 4 major serine/threonine-specific protein phosphatases involved in the dephosphorylation of a variety of proteins. These enzymes work in opposition to the protein kinases to control the level of phosphorylation. PP1 has 3 catalytic subunits, designated alpha (OMIM Ref. No. 176875), beta, and gamma. Barker et al. (1994) isolated a cDNA for PP1 beta (symbolized PPP1CB) from a teratocarcinoma library. Three different PPP1CB mRNAs were seen on Northern blots corresponding to alternate splicing variants. The 3-prime noncoding region of PPP1CB was approximately 90% conserved between man and rodents, suggesting that this region may have functional importance. Barker et al. (1994) assigned the gene for human PPP1CB to chromosome 2 using somatic cell hybrid DNAs and further localized it to 2p23 by fluorescence in situ hybridization. Saadat et al. (1994) confirmed the human map position as 2p23 and showed that rodent homologs mapped to rat 6q21-q23 and mouse 12D

[7072] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7073] Barker, H. M.; Brewis, N. D.; Street, A. J.; Spurr, N. K.; Co-

hen, P. T. W. : Three genes for protein phosphatase 1 map to different human chromosomes: sequence, expression and gene localisation of protein serine/threonine phosphatase 1 beta (PPP1CB). Biochim. Biophys. Acta 1220: 212-218, 1994. ; and

[7074] Saadat, M.; Kakinoki, Y.; Mizuno, Y.; Kikuchi, K.; Yoshida, M. C. : Chromosomal localization of human, rat, and mouse protein phosphatase type 1 beta catalytic subunit genes (PPP1CB) by.

[7075] Further studies establishing the function and utilities of PPP1CB are found in John Hopkins OMIM database record ID 600590, and in cited publications numbered 10217-10218 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693) is another VGAM46 host target gene. BIVM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BIVM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BIVM BINDING SITE, designated SEQ ID:19256, to the nucleotide sequence of VGAM46

RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7076] Another function of VGAM46 is therefore inhibition of Basic, Immunoglobulin-like Variable Motif Containing (BIVM, Accession NM_017693). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BIVM. Cadherin-like 26 (CDH26, Accession NM_021810) is another VGAM46 host target gene. CDH26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH26 BINDING SITE, designated SEQ ID:22373, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7077] Another function of VGAM46 is therefore inhibition of Cadherin-like 26 (CDH26, Accession NM_021810). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH26. FLJ10961 (Accession XM_032826) is another VGAM46 host target gene. FLJ10961 BINDING SITE

is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10961, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10961 BINDING SITE, designated SEQ ID:31777, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7078] Another function of VGAM46 is therefore inhibition of FLJ10961 (Accession XM_032826). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10961. HTMP10 (Accession NM_033207) is another VGAM46 host target gene. HTMP10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTMP10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTMP10 BINDING SITE, designated SEQ ID:27051, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7079] Another function of VGAM46 is therefore inhibition of

HTMP10 (Accession NM_033207). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTMP10. KIAA0471 (Accession NM_014857) is another VGAM46 host target gene. KIAA0471 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0471, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0471 BINDING SITE, designated SEQ ID:16916, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7080] Another function of VGAM46 is therefore inhibition of KIAA0471 (Accession NM_014857). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0471. KIAA1493 (Accession XM_034415) is another VGAM46 host target gene. KIAA1493 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1493 BINDING SITE, designated SEQ ID:32090, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7081] Another function of VGAM46 is therefore inhibition of KIAA1493 (Accession XM_034415). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1493. KIAA1634 (Accession XM_032749) is another VGAM46 host target gene. KIAA1634 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1634, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1634 BINDING SITE, designated SEQ ID:31749, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7082] Another function of VGAM46 is therefore inhibition of KIAA1634 (Accession XM_032749). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1634. KIAA1877 (Accession XM_038616) is another

VGAM46 host target gene. KIAA1877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1877 BINDING SITE, designated SEQ ID:32888, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7083] Another function of VGAM46 is therefore inhibition of KIAA1877 (Accession XM_038616). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1877. Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886) is another VGAM46 host target gene. MAL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAL2 BINDING SITE, designated SEQ ID:27470, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7084] Another function of VGAM46 is therefore inhibition of Mal, T-cell Differentiation Protein 2 (MAL2, Accession NM_052886). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAL2. SB52 (Accession NM_138335) is another VGAM46 host target gene. SB52 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SB52, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SB52 BINDING SITE, designated SEQ ID:28735, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7085] Another function of VGAM46 is therefore inhibition of SB52 (Accession NM_138335). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SB52. LOC150848 (Accession XM_097959) is another VGAM46 host target gene. LOC150848 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150848, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150848 BINDING SITE, designated SEQ ID:41262, to the nucleotide sequence of VGAM46 RNA, herein designated VGAM RNA, also designated SEQ ID:2757.

[7086] Another function of VGAM46 is therefore inhibition of LOC150848 (Accession XM_097959). Accordingly, utilities of VGAM46 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150848. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 47 (VGAM47) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7087] VGAM47 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM47 was detected is described hereinabove with reference to Figs. 1–8.

[7088] VGAM47 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM47 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7089] VGAM47 gene encodes a VGAM47 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM47 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM47 precursor RNA is designated SEQ ID:33, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:33 is located at position 25939 relative to the genome of Invertebrate Iridescent Virus 6.

[7090] VGAM47 precursor RNA folds onto itself, forming VGAM47 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7091] An enzyme complex designated DICER COMPLEX, `dices` the VGAM47 folded precursor RNA into VGAM47 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM47 RNA is designated SEQ ID:2758, and is provided hereinbelow with reference to the sequence listing part.

[7092] VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM47 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7093] VGAM47 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM47 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM47 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7094] The complementary binding of VGAM47 RNA, herein designated VGAM RNA, to host target binding sites on VGAM47 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM47 host target RNA into VGAM47 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7095] It is appreciated that VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM47 host target genes. The mRNA of each one of this plurality of VGAM47 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM47 RNA, herein designated VGAM RNA, and which when bound by VGAM47 RNA causes inhibition of translation of respective one or more VGAM47 host target proteins.

[7096] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM47 gene, herein designated VGAM GENE, on one or more VGAM47 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7097] It is yet further appreciated that a function of VGAM47 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM47 correlate with, and may be deduced from, the identity of the host target genes which VGAM47 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7098] Nucleotide sequences of the VGAM47 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM47 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM47 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM47 are further described hereinbelow with reference to Table 1.

[7099] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM47 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM47 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7100] As mentioned hereinabove with reference to Fig. 1, a function of VGAM47 gene, herein designated VGAM is inhibition of expression of VGAM47 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM47 correlate with, and may be deduced from, the identity of the target genes which VGAM47 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7101] Aspartate Beta-hydroxylase (ASPH, Accession NM_032466) is a VGAM47 host target gene. ASPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ASPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ASPH BINDING SITE, designated SEQ ID:26223, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7102] A function of VGAM47 is therefore inhibition of Aspartate

Beta-hydroxylase (ASPH, Accession NM_032466), a gene which specifically hydroxylates the beta carbon of aspartic acid or asparagine residues in certain epidermal growth factor (EGF)-like domains of a number of proteins. Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ASPH. The function of ASPH has been established by previous studies. In hepatocellular carcinoma (HCC; 114550), one of the most prevalent tumors in the world which occurs with especially high frequency in sub-Saharan Africa and the Far East, a specific antigen is highly expressed; it is highly expressed also in cholangiocarcinomas. Lavaissiere et al. (1996) reported cDNA cloning of the human gene encoding this antigen, aspartyl(asparaginyl)-beta-hydroxylase (symbolized HAAH by them), and demonstrated that in these tumor lines it is expressed in an enzymatically active form. The gene encodes a deduced 744-amino acid polypeptide with high homology (81%) to the bovine gene (Jia et al., 1992). Lavaissiere et al. (1996) found that their cDNA human sequence was 99% homologous to the sequence for ASPH reported by Koriath et al. (1994), differing only at amino acid residues 565 (tyr to ile), 575 (trp-trp-thr to cys-gly),

585 (asp to gln), and 709 (arg to lys). They noted also a silent TCG-to-TCA transition at peptide residue 161.

Lavaissiere et al. (1996) speculated about the possible relationship of the malignant phenotype of regulated aspartyl/asparaginyl-beta-hydroxylation in EGF-like domains of proteins such as the mammalian Notch homologs (e.g., 190198, 600275, and 600276), which are known to be involved in cell differentiation and whose cytoplasmic domains have been shown to be oncogenic. By screening a heart cDNA library, followed by RT-PCR, Lim et al. (2000) isolated cDNAs encoding the 225-amino acid junctin protein and a 210-amino acid isoform. The authors noted that a 73-residue stretch in junctin has a completely matched region in the ASPH protein. Southern blot analysis indicated that junctin and ASPH exist as a single-copy gene. Northern blot analysis revealed expression of 3.0- and 4.2-kb transcripts in cardiac and skeletal muscle; expression was higher in skeletal muscle. SDS-PAGE analysis of the translated cDNAs showed expression of 26- and 28-kD proteins. By screening a skeletal muscle cDNA library with a dog junctin probe, Treves et al. (2000) identified cDNAs encoding human junctin and junctate. Sequence analysis predicted that junctate, a 299-amino

acid protein, shares the first 93 amino acids of the long isoform of junctin (and, partially, of ASPH), whereas its 64 C-terminal residues are identical to the central region of ASPH. Northern blot analysis detected a 2.6-kb transcript in heart, brain, pancreas, placenta, lung, liver, kidney, and skeletal muscle; highest levels were in heart, brain, and pancreas, and lowest levels were in skeletal muscle. In contrast, junctin was expressed only in cardiac and skeletal muscle. Southern blot and PCR analyses indicated that ASPH, junctin, and junctate are splice variants of the same gene; ASPH uses exons 1, 3, 5, and 8 through 16, whereas junctin uses exons 2, 3, 5, and 6, and junctate uses exons 2 through 5 and 8 through 16. Fluorescence microscopy showed junctate expression in sarco(endo)plasmic reticulum membranes. Immunoblot analysis indicated that junctate is expressed as a 32-kD protein in kidney microsomes. Binding analysis determined that junctate binds calcium with high capacity and moderate affinity.

[7103] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7104] Lavaissiere, L.; Jia, S.; Nishiyama, M.; de la Monte, S.; Stern, A. M.; Wands, J. R.; Friedman, P. A. : Overexpression

of human aspartyl(asparaginyl)-beta-hydroxylase in hepatocellular carcinoma and cholangiocarcinoma. J. Clin. Invest. 98: 1313-1323, 1996. ; and

[7105] Treves, S.; Feriotto, G.; Moccagatta, L.; Gambari, R.; Zorzato, F. : Molecular cloning, expression, functional characterization, chromosomal localization, and gene structure of junctate.

[7106] Further studies establishing the function and utilities of ASPH are found in John Hopkins OMIM database record ID 600582, and in cited publications numbered 10187-10193 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 5A2 (EIF5A2, Accession NM_020390) is another VGAM47 host target gene. EIF5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5A2 BINDING SITE, designated SEQ ID:21659, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7107] Another function of VGAM47 is therefore inhibition of Eukaryotic Translation Initiation Factor 5A2 (EIF5A2, Accession NM_020390). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5A2. RP42 (Accession NM_020640) is another VGAM47 host target gene. RP42 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP42, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP42 BINDING SITE, designated SEQ ID:21801, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7108] Another function of VGAM47 is therefore inhibition of RP42 (Accession NM_020640), a gene which not clear yet. Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP42. The function of RP42 has been established by previous studies. In a systematic search for genes expressed in proliferating neuroblasts whose human orthologs map to susceptibility loci for autism (OMIM Ref. No. 209850), Mas et al. (2000) isolated a novel mouse

gene, which they designated RP42. They obtained the human homolog by combining contigs of human ESTs and RT-PCR of human embryonic mRNAs. The deduced human and mouse RP42 proteins contain 259 amino acids and differ by only 2 residues. They show 30 to 36% overall sequence identity to an *S. pombe* and a *C. elegans* protein, suggesting that the RP42 protein has an important cellular function. Northern blot analysis in the mouse embryo demonstrated expression of 2 transcripts, with the larger transcript reaching peak expression from E11 to E15, and the smaller transcript showing high expression from E7 to E15, indicating developmentally regulated expression, which was found particularly in proliferating neuroblasts. In mouse adult tissues, 3 transcripts were expressed in testis, kidney, liver, skeletal muscle, and heart, with weaker expression in brain. Northern blot analysis of adult human tissues detected 2 RP42 transcripts of approximately 3.7 and 2.7 kb at lower levels of expression than in mouse. RT-PCR showed that RP42 is expressed in the human embryo telencephalon Mas et al. (2000) identified the human RP42 sequence in a cluster of embryonic neuronally expressed genes on a PAC mapping to 6q16, making it a candidate gene for the susceptibility autism locus

previously assigned to this region

[7109] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7110] Mas, C.; Bourgeois, F.; Bulfone, A.; Levacher, B.; Mugnier, C.; Simonneau, M. : Cloning and expression analysis of a novel gene, RP42, mapping to an autism susceptibility locus on 6q16. Genomics 65: 70–74, 2000. ; and

[7111] Mas, C.; Bourgeois, F.; Bulfone, A.; Levacher, B.; Mugnier, C.; Simonneau, M. : Cloning and expression analysis of a novel gene, RP42, mapping to an autism susceptibility locus on 6q16. Ge.

[7112] Further studies establishing the function and utilities of RP42 are found in John Hopkins OMIM database record ID 605905, and in cited publications numbered 739 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Splicing Factor, Arginine/serine-rich 2 (SFRS2, Accession XM_036785) is another VGAM47 host target gene. SFRS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SFRS2 BINDING SITE, designated SEQ ID:32504, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7113] Another function of VGAM47 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2 (SFRS2, Accession XM_036785), a gene which is necessary for the splicing of pre-mrna. Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2. The function of SFRS2 has been established by previous studies. Fu and Maniatis (1992) isolated a human cDNA termed pre-mRNA splicing factor SC35, or SFRS2, that is required for spliceosome assembly. The predicted protein contains a ribonucleoprotein (RNP)-type RNA-binding motif and a carboxyl-terminal serine/arginine-rich (SR) domain. Wang et al. (2001) reported that Cre-mediated conditional deletion of the prototypical SR protein Sc35 in mouse thymus caused a defect in T-cell maturation. Deletion of Sc35 altered alternative splicing of CD45 (OMIM Ref. No. 151460), a receptor tyrosine phosphatase regulated by differential splicing during thymocyte development and activation.

[7114] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

[7115] Fu, X.-D.; Maniatis, T. : Isolation of a complementary DNA that encodes the mammalian splicing factor SC35. Science 256: 535-538, 1992. ; and

[7116] Wang, H.-Y.; Xu, X.; Ding, J.-H.; Bermingham, J. R., Jr.; Fu, X.-D. : SC35 plays a role in T cell development and alternative splicing of CD45. Molec. Cell 7: 331-342, 2001.

[7117] Further studies establishing the function and utilities of SFRS2 are found in John Hopkins OMIM database record ID 600813, and in cited publications numbered 713 and 7140-7142 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TSG (Accession NM_020648) is another VGAM47 host target gene. TSG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSG BINDING SITE, designated SEQ ID:21811, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7118] Another function of VGAM47 is therefore inhibition of TSG

(Accession NM_020648). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSG. KIAA1332 (Accession XM_048774) is another VGAM47 host target gene. KIAA1332 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1332 BINDING SITE, designated SEQ ID:35258, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7119] Another function of VGAM47 is therefore inhibition of KIAA1332 (Accession XM_048774). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1332. KIAA1912 (Accession XM_055636) is another VGAM47 host target gene. KIAA1912 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1912 BINDING SITE, designated SEQ ID:36313, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7120] Another function of VGAM47 is therefore inhibition of KIAA1912 (Accession XM_055636). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1912. LOC127534 (Accession XM_060532) is another VGAM47 host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37172, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7121] Another function of VGAM47 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC146880 (Accession XM_085627) is an-

other VGAM47 host target gene. LOC146880 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146880, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146880 BINDING SITE, designated SEQ ID:38259, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7122] Another function of VGAM47 is therefore inhibition of LOC146880 (Accession XM_085627). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146880. LOC221656 (Accession XM_166418) is another VGAM47 host target gene. LOC221656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221656 BINDING SITE, designated SEQ ID:44294, to the nucleotide sequence of VGAM47 RNA, herein designated VGAM RNA, also designated SEQ ID:2758.

[7123] Another function of VGAM47 is therefore inhibition of LOC221656 (Accession XM_166418). Accordingly, utilities of VGAM47 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221656. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 48 (VGAM48) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7124] VGAM48 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM48 was detected is described hereinabove with reference to Figs. 1–8.

[7125] VGAM48 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7126] VGAM48 gene encodes a VGAM48 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM48

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM48 precursor RNA is designated SEQ ID:34, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:34 is located at position 168080 relative to the genome of Invertebrate Iridescent Virus 6.

[7127] VGAM48 precursor RNA folds onto itself, forming VGAM48 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7128] An enzyme complex designated DICER COMPLEX, `dices` the VGAM48 folded precursor RNA into VGAM48 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 46%) nucleotide sequence of VGAM48 RNA is designated SEQ ID:2759, and is provided hereinbelow with reference to the sequence listing part.

- [7129] VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM48 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.
- [7130] VGAM48 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM48 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host tar-

get binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM48 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7131] The complementary binding of VGAM48 RNA, herein designated VGAM RNA, to host target binding sites on VGAM48 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM48 host target RNA into VGAM48 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7132] It is appreciated that VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM48 host target genes. The mRNA of each one of this plurality of VGAM48 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM48 RNA, herein designated VGAM RNA, and which when bound by VGAM48 RNA causes inhibition of translation of respective one or more VGAM48 host target proteins.

[7133] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM48 gene, herein designated VGAM GENE, on one or more VGAM48 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7134] It is yet further appreciated that a function of VGAM48 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM48 correlate with, and may be deduced from, the identity of the host target genes which VGAM48 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7135] Nucleotide sequences of the VGAM48 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM48 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM48 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM48 are further described hereinbelow with reference to Table 1.

[7136] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM48 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM48 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7137] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM48 gene, herein designated VGAM is inhibition of expression of VGAM48 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM48 correlate with, and may be deduced from, the identity of the target genes which VGAM48 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7138] Chloride Channel 5 (nephrolithiasis 2, X-linked, Dent disease) (CLCN5, Accession NM_000084) is a VGAM48 host target gene. CLCN5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLCN5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLCN5 BINDING SITE, designated SEQ ID:5535, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:2759.

[7139] A function of VGAM48 is therefore inhibition of Chloride Channel 5 (nephrolithiasis 2, X-linked, Dent disease) (CLCN5, Accession NM_000084), a gene which may interfere in renal tubular function. Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with CLCN5. The function of CLCN5 has been established by previous studies. Lloyd et al. (1996) found mutations in the CLCN5 gene in each of 11 kindreds with different renal tubular disorders complicated by kidney stone formation (nephrolithiasis): Dent disease, X-linked recessive nephrolithiasis (OMIM Ref. No. 310468), and X-linked recessive hypophosphatemic rickets (OMIM Ref. No. 307800). There are clearly 2 or more forms of X-linked recessive hypophosphatemia, because one form has already been identified as due to mutations in the gene variously symbolized HYP or PEX, an X-linked phosphate regulating gene with homologies to endopeptidases (see, OMIM Ref. No., for example, 307800.0001). Lloyd et al. (1996) found that heterologous expression of wildtype CLCN5 in *Xenopus* oocytes yielded outwardly rectifying chloride currents, which were either abolished or markedly reduced by the mutations they found in the gene in these families. Lloyd et al. (1996) found Dent disease associated with the mutations W279X (300008.0001), R648X (300008.0002), L200R (300008.0003), S529P (300008.0004), 2 microdeletions, and 2 donor splice site mutations; X-linked nephrolithia-

sis was associated with R704X (300008.0005) and G506E (300008.0006); and X-linked hypophosphatemia was associated with S244L (300008.0007). All the disease-causing missense mutations were confined to the predicted transmembrane domains. In addition, the R648X and R704X mutations, which predicted a loss of 142 amino acids from the cytoplasmic C-terminus, had deleted domain D13, which is conserved in all eukaryotic chloride channel proteins. The donor splice site mutations, which were associated with a loss of exon 5, led to an in-frame deletion of the predicted transmembrane domain D2. An annual urinary screening program of Japanese children above 3 years of age identified a progressive proximal renal tubular disorder characterized by low molecular weight proteinuria, hypercalciuria, and nephrocalcinosis (Igarashi et al., 1995). Some children additionally demonstrated hematuria, glycosuria, aminoaciduria, impaired urinary concentrating ability, and mild decrease in creatinine clearance. The disease occurred predominantly in males and had been reported to be familial. Although the disorder was similar to Dent disease, notable differences were the lack of rickets or renal failure in the Japanese children. Lloyd et al. (1997) investigated 4 unrelated

Japanese kindreds with this tubulopathy and identified 4 different CLCN5 mutations (2 OMIM Ref. No. 300008.0008). Mutational screening of CLCN5 by SSCP analysis was predicted to help supplement the clinical evaluation of the annual urinary screening program for this disorder. Animal model experiments lend further support to the function of CLCN5. Piwon et al. (2000) created an animal model of Dent disease by targeted disruption of the *Clcn5* gene in mice. *Clcn5* $-/-$ mice had proteinuria due to strong reduction of apical proximal tubular endocytosis. Both receptor-mediated and fluid-phase endocytosis were affected, and the internalization of the apical transporters NaPi2 and NHE3 (OMIM Ref. No. 182307) was slowed. At steady state, however, both proteins were redistributed from the plasma membrane to intracellular vesicles. Piwon et al. (2000) postulated that this may have been caused by an increased stimulation of luminal parathyroid hormone (PTH; 168450) receptors (see OMIM Ref. No. 168468) owing to the observed decreased tubular endocytosis of PTH. The rise in luminal PTH concentration should also stimulate the hydroxylation of 25-hydroxy vitamin D3 to the active hormone. However, this would be counteracted by a urinary loss of the pre-

cursor 25-hydroxy vitamin D3. The balance between these opposing effects, both of which are secondary to the defect in proximal tubular endocytosis, probably determines whether there will be hypercalciuria and kidney stones. Piwon et al. (2000) showed that CLC5 is crucial for efficient endocytosis in the proximal tubule. CLC5 was the first intracellular chloride channel for which a role in vesicle trafficking was established. Piwon et al. (2000) argued that their mouse model strongly suggests that alterations in hormones involved in calcium homeostasis, and hyperphosphaturia and hypocalciuria, are indirect effects of defective apical endocytosis of PTH and 25-hydroxy D3; this may explain how a defect in a chloride channel could lead to kidney stones.

[7140] It is appreciated that the abovementioned animal model for CLCN5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7141] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7142] Igarashi, T.; Hayakawa, H.; Shiraga, H.; Kawato, H.; Yan, K.; Kawaguchi, H.; Yamanake, T.; Tsuchida, S.; Akagi, K. :

Hypercalciuria and nephrocalcinosis in patients with idiopathic low molecular weight proteinuria in Japan: is the disease identical to Dent's disease in the United Kingdom? Nephron. 69: 242–247, 1995. ; and

[7143] Lloyd, S. E.; Gunther, W.; Pearce, S. H. S.; Thomson, A.; Bianchi, M. L.; Bosio, M.; Craig, I. W.; Fisher, S. E.; Scheinman, S. J.; Wrong, O.; Jentsch, T. J.; Thakker, R. V. : Character.

[7144] Further studies establishing the function and utilities of CLCN5 are found in John Hopkins OMIM database record ID 300008, and in cited publications numbered 6569–6583 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM48 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31079, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:2759.

[7145] Another function of VGAM48 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. KIAA1383 (Accession XM_045859) is another VGAM48 host target gene. KIAA1383 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1383, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1383 BINDING SITE, designated SEQ ID:34583, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:2759.

[7146] Another function of VGAM48 is therefore inhibition of KIAA1383 (Accession XM_045859). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1383. LOC219722 (Accession XM_167593) is another VGAM48 host target gene. LOC219722 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219722, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219722 BINDING SITE, designated SEQ ID:44708, to the nucleotide sequence of VGAM48 RNA, herein designated VGAM RNA, also designated SEQ ID:2759.

[7147] Another function of VGAM48 is therefore inhibition of LOC219722 (Accession XM_167593). Accordingly, utilities of VGAM48 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219722. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 49 (VGAM49) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7148] VGAM49 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM49 was detected is described hereinabove with reference to Figs. 1–8.

[7149] VGAM49 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7150] VGAM49 gene encodes a VGAM49 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM49 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM49 precursor RNA is designated SEQ ID:35, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:35 is located at position 104443 relative to the genome of Invertebrate Iridescent Virus 6.

[7151] VGAM49 precursor RNA folds onto itself, forming VGAM49 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[7152] An enzyme complex designated DICER COMPLEX, `dices` the VGAM49 folded precursor RNA into VGAM49 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM49 RNA is designated SEQ ID:2760, and is provided hereinbelow with reference to the sequence listing part.

[7153] VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM49 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7154] VGAM49 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM49 host target RNA,

herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM49 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM49 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7155] The complementary binding of VGAM49 RNA, herein designated VGAM RNA, to host target binding sites on VGAM49 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM49 host tar-

get RNA into VGAM49 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7156] It is appreciated that VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM49 host target genes. The mRNA of each one of this plurality of VGAM49 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM49 RNA, herein designated VGAM RNA, and which when bound by VGAM49 RNA causes inhibition of translation of respective one or more VGAM49 host target proteins.

[7157] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM49 gene, herein designated VGAM GENE, on one or more VGAM49 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and

Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7158] It is yet further appreciated that a function of VGAM49 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM49 correlate with, and may be deduced from, the identity of the host target genes which VGAM49 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7159] Nucleotide sequences of the VGAM49 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM49 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM49 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM49 are further described hereinbelow with reference to Table 1.

[7160] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM49 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM49 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7161] As mentioned hereinabove with reference to Fig. 1, a function of VGAM49 gene, herein designated VGAM is inhibition of expression of VGAM49 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM49 correlate with, and may be deduced from, the identity of the target genes which VGAM49 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7162] Immunoglobulin J Polypeptide, Linker Protein For Immunoglobulin Alpha and Mu Polypeptides (IGJ, Accession NM_144646) is a VGAM49 host target gene. IGJ BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IGJ, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IGJ BIND-

ING SITE, designated SEQ ID:29472, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7163] A function of VGAM49 is therefore inhibition of Immunoglobulin J Polypeptide, Linker Protein For Immunoglobulin Alpha and Mu Polypeptides (IGJ, Accession NM_144646), a gene which serves to link two monomer units of either igm or iga and also helps to bind these immunoglobulins to secretory components. Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IGJ. The function of IGJ has been established by previous studies. J chain is a 137-amino acid protein that is synthesized in B lymphocytes and serves 2 known functions: linking immunoglobulin monomers (IgM to pentamers, IgA to dimers) and binding these immunoglobulins to secretory component (Koshland, 1985). Using probes from J chain clones, Max et al. (1986) assigned the J chain gene to 4q21 by Southern analysis of somatic cell hybrids and by in situ hybridization. This band is the site of translocations with chromosome 11 in some acute lymphocytic leukemias. In the mouse, JCH maps to chromosome 5 which carries 4 other genes that are also on hu-

man no. 4 (PGM2, PEPS, ALB, and AFP). Max et al. (1986) also discovered genetic variation in the number of repeats of a 27-bp sequence that is tandemly reduplicated 5-prime of the human J chain gene. They suggested that this polymorphism may be 'useful in genetic linkage studies in a region of chromosome 4 heretofore relatively barren of markers definitively localized to a particular sub-band.' (The OMIM Ref. No. 146970, 147010, 147230 for the J region genes of kappa, heavy and lambda chains, respectively.)

- [7164] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [7167] Further studies establishing the function and utilities of IGJ are found in John Hopkins OMIM database record ID 147790, and in cited publications numbered 11593-11594 listed in the bibliography section hereinbe-

low, which are also hereby incorporated by reference. ATP6M8-9 (Accession NM_005765) is another VGAM49 host target gene. ATP6M8-9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6M8-9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6M8-9 BINDING SITE, designated SEQ ID:12327, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7168] Another function of VGAM49 is therefore inhibition of ATP6M8-9 (Accession NM_005765). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6M8-9. KIAA0447 (Accession XM_049733) is another VGAM49 host target gene. KIAA0447 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0447, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0447 BINDING SITE, designated SEQ ID:35490, to the

nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7169] Another function of VGAM49 is therefore inhibition of KIAA0447 (Accession XM_049733). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0447. MGC11352 (Accession XM_035941) is another VGAM49 host target gene. MGC11352 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11352, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11352 BINDING SITE, designated SEQ ID:32356, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7170] Another function of VGAM49 is therefore inhibition of MGC11352 (Accession XM_035941). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11352. LOC136015 (Accession XM_072440) is another VGAM49 host target gene. LOC136015 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC136015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC136015 BINDING SITE, designated SEQ ID:37500, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7171] Another function of VGAM49 is therefore inhibition of LOC136015 (Accession XM_072440). Accordingly, utilities of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC136015. LOC154788 (Accession XM_098607) is another VGAM49 host target gene. LOC154788 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154788, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154788 BINDING SITE, designated SEQ ID:41725, to the nucleotide sequence of VGAM49 RNA, herein designated VGAM RNA, also designated SEQ ID:2760.

[7172] Another function of VGAM49 is therefore inhibition of LOC154788 (Accession XM_098607). Accordingly, utilities

of VGAM49 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154788. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 50 (VGAM50) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7173] VGAM50 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM50 was detected is described hereinabove with reference to Figs. 1–8.

[7174] VGAM50 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7175] VGAM50 gene encodes a VGAM50 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM50 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM50 precursor RNA is designated SEQ ID:36, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:36 is located at position 92898 relative to the genome of Invertebrate Iridescent Virus 6.

[7176] VGAM50 precursor RNA folds onto itself, forming VGAM50 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7177] An enzyme complex designated DICER COMPLEX, `dices` the VGAM50 folded precursor RNA into VGAM50 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM50 RNA is designated SEQ ID:2761, and is

provided hereinbelow with reference to the sequence listing part.

[7178] VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM50 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7179] VGAM50 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM50 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM50 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7180] The complementary binding of VGAM50 RNA, herein designated VGAM RNA, to host target binding sites on VGAM50 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM50 host target RNA into VGAM50 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7181] It is appreciated that VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM50 host target genes. The mRNA of each one of this plurality of VGAM50 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM50 RNA, herein designated VGAM

RNA, and which when bound by VGAM50 RNA causes inhibition of translation of respective one or more VGAM50 host target proteins.

[7182] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM50 gene, herein designated VGAM GENE, on one or more VGAM50 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7183] It is yet further appreciated that a function of VGAM50 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM50 include diagnosis, prevention and

treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM50 correlate with, and may be deduced from, the identity of the host target genes which VGAM50 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7184] Nucleotide sequences of the VGAM50 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM50 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM50 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM50 are further described hereinbelow with reference to Table 1.

[7185] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM50 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM50 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7186] As mentioned hereinabove with reference to Fig. 1, a function of VGAM50 gene, herein designated VGAM is inhibition of expression of VGAM50 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM50 correlate with, and may be deduced from, the identity of the target genes which VGAM50 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7187] Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949) is a VGAM50 host target gene. INPP5B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5B BINDING SITE, designated SEQ ID:45733, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:2761.

[7188] A function of VGAM50 is therefore inhibition of Inositol Polyphosphate-5-phosphatase, 75kDa (INPP5B, Accession XM_170949), a gene which hydrolyzes the calcium-mobilizing second messenger $\text{ins}(1,4,5)\text{p3}$. Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5B. The function of INPP5B has been established

by previous studies. The 75-kD inositol polyphosphate-5-phosphatase enzyme was originally isolated from human platelets and cloned from human megakaryocytic and placental cDNA libraries (Ross et al., 1991). It is 1 of at least 3 enzymes known to catalyze the conversion of inositol-1,4,5-triphosphate (IP3) to inositol-1,4-biphosphate (IP2). Three enzymes with this activity were identified: a 45-kD polypeptide, a 75-kD polypeptide, and a 120-kD polypeptide. By fluorescence in situ hybridization, Janne et al. (1994) found that the gene for the 75-kD enzyme (OMIM Ref. No. INPP5B) is located on band 1p34. The result was corroborated by Southern blot analysis of rodent/human hybrids containing portions of chromosome 1. Janne et al. (1995) determined that the mouse *Inpp5b* gene is located on distal mouse chromosome 4 within the conserved linkage group corresponding to human 1p. The gene is in the vicinity of the mouse developmental mutation 'dysgenetic lens' (*dyl*); however, using a genetic approach, Janne et al. (1995) showed that *Inpp5b* maps distal to *dyl* on mouse chromosome 4.

[7189] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7190] Janne, P. A.; Dutra, A. S.; Dracopoli, N. C.; Charnas, L. R.; Puck, J. M.; Nussbaum, R. L. : Localization of the 75-kDa inositol polyphosphate-5-phosphatase (INPP5B) to human chromosome band 1p34. Cytogenet. Cell Genet. 66: 164-166, 1994. ; and

[7191] Janne, P. A.; Rochelle, J. M.; Martin-DeLeon, P. A.; Stambolian, D.; Seldin, M. F.; Nussbaum, R. L. : Mapping of the 75-kDa inositol polyphosphate-5-phosphatase (Inpp5b) to distal mouse.

[7192] Further studies establishing the function and utilities of INPP5B are found in John Hopkins OMIM database record ID 147264, and in cited publications numbered 4973-4975 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 18 (KOX 11) (ZNF18, Accession XM_085596) is another VGAM50 host target gene. ZNF18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF18 BINDING SITE, designated SEQ ID:38249, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA,

also designated SEQ ID:2761.

[7193] Another function of VGAM50 is therefore inhibition of Zinc Finger Protein 18 (K0X 11) (ZNF18, Accession XM_085596). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF18. Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549) is another VGAM50 host target gene. CAMKK2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAMKK2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAMKK2 BINDING SITE, designated SEQ ID:13310, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:2761.

[7194] Another function of VGAM50 is therefore inhibition of Calcium/calmodulin-dependent Protein Kinase Kinase 2, Beta (CAMKK2, Accession NM_006549). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAMKK2. DKFZp547H025 (Accession NM_020161) is an-

other VGAM50 host target gene. DKFZp547H025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547H025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547H025 BINDING SITE, designated SEQ ID:21368, to the nucleotide sequence of VGAM50 RNA, herein designated VGAM RNA, also designated SEQ ID:2761.

[7195] Another function of VGAM50 is therefore inhibition of DKFZp547H025 (Accession NM_020161). Accordingly, utilities of VGAM50 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547H025. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 51 (VGAM51) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7196] VGAM51 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM51 was detected is described hereinabove with reference to Figs. 1–8.

[7197] VGAM51 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7198] VGAM51 gene encodes a VGAM51 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM51 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM51 precursor RNA is designated SEQ ID:37, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:37 is located at position 57805 relative to the genome of Invertebrate Iridescent Virus 6.

[7199] VGAM51 precursor RNA folds onto itself, forming VGAM51 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7200] An enzyme complex designated DICER COMPLEX, `dices` the VGAM51 folded precursor RNA into VGAM51 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM51 RNA is designated SEQ ID:2762, and is provided hereinbelow with reference to the sequence listing part.

[7201] VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM51 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7202] VGAM51 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM51 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM51 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM51 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7203] The complementary binding of VGAM51 RNA, herein designated VGAM RNA, to host target binding sites on VGAM51 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM51 host target RNA into VGAM51 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7204] It is appreciated that VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM51 host target genes. The mRNA of each one of this plurality of VGAM51 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM51 RNA, herein designated VGAM RNA, and which when bound by VGAM51 RNA causes inhibition of translation of respective one or more VGAM51 host target proteins.

[7205] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM51 gene, herein designated VGAM GENE, on one or more VGAM51 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7206] It is yet further appreciated that a function of VGAM51 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM51 correlate with, and may be deduced from, the identity of the host target genes which VGAM51 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7207] Nucleotide sequences of the VGAM51 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM51 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM51 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM51 are further described hereinbelow with reference to Table 1.

[7208] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM51 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM51 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7209] As mentioned hereinabove with reference to Fig. 1, a function of VGAM51 gene, herein designated VGAM is inhibition of expression of VGAM51 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM51 correlate with, and may be deduced from, the identity of the target genes which VGAM51 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7210] Desmin (DES, Accession XM_050962) is a VGAM51 host target gene. DES BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DES, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of DES BINDING SITE, designated SEQ ID:35692, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7211] A function of VGAM51 is therefore inhibition of Desmin (DES, Accession XM_050962). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DES. Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006) is another VGAM51 host target gene. FGF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF2 BINDING SITE, designated SEQ ID:7741, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7212] Another function of VGAM51 is therefore inhibition of Fibroblast Growth Factor 2 (basic) (FGF2, Accession NM_002006), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FGF2. The function of FGF2 has been established by previous studies. See fibroblast growth factor-12 (FGF12; 601513). By Southern blot hybridization of genomic DNA from rodent/human hybrid cell lines carrying individual human chromosomes, Smallwood et al. (1996) mapped the FHF2 gene (also symbolized FGF13) to the X chromosome. By using an interspecific backcross mapping panel, they demonstrated that the mouse gene, Fhf2, shows no recombination with the gene for CD40 antigen ligand (OMIM Ref. No. 300386). Thus the human gene is probably located at Xq26. By use of isotopic in situ hybridization, Lovec et al. (1997) assigned the FHF2 gene to Xq21. Gecz et al. (1999), however, provided evidence that the FHF2 gene is located in Xq26.3. They identified a male patient with features of Borjeson-Forssman-Lehmann syndrome (BFLS; 301900) and a duplication of the Xq26-q28 region. By FISH using YAC clones from Xq26, they localized the duplication breakpoint to an interval of approximately 400 kb in the Xq26.3 region between DXS155 and DXS294/DXS730. Database searches and an analysis of available genomic sequence from the region showed that the FHF2 gene is located within the duplication breakpoint

interval. Gecz et al. (1999) determined the structure of the FHF2 gene and identified 2 new exons, including a new 5-prime end exon, designated 1B. FHF2 is a large gene, extending over approximately 200 kb in Xq26.3, and contains at least 7 exons. It shows tissue-specific alternative splicing and alternative transcription starts. Northern blot hybridization showed highest expression in brain and skeletal muscle. The localization and tissue-specific expression pattern of FHF2 made it a possible candidate gene for familial cases of BFLS and for other syndromal and nonspecific forms of X-linked mental retardation mapping to that region. Animal model experiments lend further support to the function of FGF2.

[7213] It is appreciated that the abovementioned animal model for FGF2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7214] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7215] Gecz, J.; Baker, E.; Donnelly, A.; Ming, J. E.; McDonald-McGinn, D. M.; Spinner, N. B.; Zackai, E. H.; Sutherland, G. R.; Mulley, J. C. : Fibroblast growth factor homologous

factor 2 (FHF2): gene structure, expression and mapping to the Borjeson–Forssman–Lehmann syndrome region in Xq26 delineated by a duplication breakpoint in a BFLS–like patient. Hum. Genet. 104: 56–63, 1999. ; and

[7216] Lovec, H.; Hartung, H.; Verdier, A.–S.; Mattei, M.–G.; Birnbaum, D.; Goldfarb, M.; Coulier, F. : Assignment of FGF13 to human chromosome band Xq21 by in situ hybridization. Cytogenet.

[7217] Further studies establishing the function and utilities of FGF2 are found in John Hopkins OMIM database record ID 300070, and in cited publications numbered 9084–9086 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 4B, CAMP–specific (phosphodiesterase E4 duncce homolog, Drosophila) (PDE4B, Accession NM_002600) is another VGAM51 host target gene. PDE4B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE4B BINDING SITE, designated SEQ ID:8467, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also desig–

nated SEQ ID:2762.

[7218] Another function of VGAM51 is therefore inhibition of Phosphodiesterase 4B, CAMP-specific (phosphodiesterase E4 dunce homolog, *Drosophila*) (PDE4B, Accession NM_002600), a gene which may be involved in mediating central nervous system effects of therapeutic agents ranging from antidepressants to antiasthmatic and anti-inflammatory agents. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE4B. The function of PDE4B has been established by previous studies. Huston et al. (1997) cloned a novel human (plus its cognate rat) PDE4B splice variant and compared its activities to the 2 other splice variants from this locus. Alternative splicing of mRNA generated from both the human and rat PDE4B genes produced long and short splice variants that had unique N-terminal regions. It was suggested that these alternatively spliced regions determined changes in the maximal catalytic activity of the isoforms, their susceptibility to inhibition by rolipram, and mode of interaction with particulate fractions. Milatovich et al. (1994) mapped the PDE4B gene to human 1p31 by a combination of Southern analysis of somatic cell hybrid lines and fluores-

cence in situ hybridization (FISH); they assigned the mouse homolog to chromosome 4 by Southern analysis of recombinant inbred (RI) mouse strains. Through the use of somatic cell hybrids segregating either human or rat chromosomes, Szpirer et al. (1995) mapped the PDE4B gene to human chromosome 1 and rat chromosome 5.

[7219] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7220] Huston, E.; Lumb, S.; Russell, A.; Catterall, C.; Ross, A. H.; Steele, M. R.; Bolger, G. B.; Perry, M. J.; Owens, R. J.; Houslay, M. D. : Molecular cloning and transient expression in COS7 cells of a novel human PDE4B cAMP-specific phosphodiesterase, HSPDE4B3. *Biochem. J.* 328: 549–558, 1997. ; and

[7221] Milatovich, A.; Bolger, G.; Michaeli, T.; Francke, U. : Chromosome localizations of genes for five cAMP-specific phosphodiesterases in man and mouse. *Somat. Cell Molec. Genet.* 20: 75–86.

[7222] Further studies establishing the function and utilities of PDE4B are found in John Hopkins OMIM database record ID 600127, and in cited publications numbered 1345, 1244 and 1346–1347 listed in the bibliography section

hereinbelow, which are also hereby incorporated by reference. Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102) is another VGAM51 host target gene. RERE BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RERE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RERE BINDING SITE, designated SEQ ID:14407, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7223] Another function of VGAM51 is therefore inhibition of Arginine–glutamic Acid Dipeptide (RE) Repeats (RERE, Accession NM_012102), a gene which binds DRPLA and locates in the nucleus. Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RERE. The function of RERE has been established by previous studies. Northern blot analysis detected 2 RERE transcripts: one of 9 kb, expressed exclusively in pancreas and testis; and one of 7 kb, expressed most strongly in skeletal muscle with weaker expression in other tissues tested, including brain. The RERE protein migrated at an apparent molecular

weight of 212 kD in SDS-PAGE. An RERE fusion protein localized predominantly in the nucleus. Immunoprecipitation and in vitro binding assays demonstrated that the DRPLA and RERE proteins bind each other, which is facilitated by one of the RE repeats, and that extension of the DRPLA polyglutamine tract enhances the binding. Moreover, when RERE is overexpressed, the distribution of endogenous DRPLA protein alters from a diffuse to a speckled pattern in the nucleus so as to colocalize with RERE. More RERE protein is recruited into nuclear aggregates of the DRPLA protein with extended polyglutamine than into those of pure polyglutamine. The authors suggested a function for the DRPLA protein in the nucleus and the RE repeat in the protein-protein interaction. By study of a YAC spanning a translocation/duplication breakpoint within the minimally defined loss of heterozygosity region at 1p36.2-p36.1 in a neuroblastoma cell line, Amler et al. (2000) identified the RERE gene, which they designated DNB1/ARP (deleted in neuroblastoma-1/atrophin-related protein).

[7224] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [7225] Amler, L. C.; Bauer, A.; Corvi, R.; Dihlmann, S.; Praml, C.; Cavenee, W. K.; Schwab, M.; Hampton, G. M. : Identification and characterization of novel genes located at the t(1;15)(p36.2;q24) translocation breakpoint in the neuroblastoma cell line NGP. *Genomics* 64: 195–202, 2000. ; and

- [7227] Further studies establishing the function and utilities of RERE are found in John Hopkins OMIM database record ID 605226, and in cited publications numbered 7304–7305 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ARG99 (Accession NM_031920) is another VGAM51 host target gene. ARG99 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARG99, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARG99 BINDING SITE, designated SEQ ID:25670, to the nucleotide sequence of VGAM51 RNA, herein designated

VGAM RNA, also designated SEQ ID:2762.

[7228] Another function of VGAM51 is therefore inhibition of ARG99 (Accession NM_031920). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARG99. FLJ12592 (Accession NM_032169) is another VGAM51 host target gene. FLJ12592 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12592 BINDING SITE, designated SEQ ID:25872, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7229] Another function of VGAM51 is therefore inhibition of FLJ12592 (Accession NM_032169). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12592. KIAA0266 (Accession NM_021645) is another VGAM51 host target gene. KIAA0266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0266, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0266 BINDING SITE, designated SEQ ID:22312, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7230] Another function of VGAM51 is therefore inhibition of KIAA0266 (Accession NM_021645). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0266. KIAA0478 (Accession NM_014870) is another VGAM51 host target gene. KIAA0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0478 BINDING SITE, designated SEQ ID:16979, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7231] Another function of VGAM51 is therefore inhibition of KIAA0478 (Accession NM_014870). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0478. KIAA0493 (Accession XM_034717) is another VGAM51 host target gene. KIAA0493 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0493, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0493 BINDING SITE, designated SEQ ID:32143, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7232] Another function of VGAM51 is therefore inhibition of KIAA0493 (Accession XM_034717). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0493. LOC127428 (Accession XM_059144) is another VGAM51 host target gene. LOC127428 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127428, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127428 BINDING SITE, designated SEQ ID:36900, to

the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7233] Another function of VGAM51 is therefore inhibition of LOC127428 (Accession XM_059144). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127428. LOC152313 (Accession XM_098190) is another VGAM51 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41470, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7234] Another function of VGAM51 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC201952 (Accession XM_117345) is another VGAM51 host target gene. LOC201952 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC201952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201952 BINDING SITE, designated SEQ ID:43397, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7235] Another function of VGAM51 is therefore inhibition of LOC201952 (Accession XM_117345). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201952. LOC220672 (Accession XM_017177) is another VGAM51 host target gene. LOC220672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220672, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220672 BINDING SITE, designated SEQ ID:30308, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7236] Another function of VGAM51 is therefore inhibition of LOC220672 (Accession XM_017177). Accordingly, utilities

of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220672. LOC221395 (Accession XM_166354) is another VGAM51 host target gene. LOC221395 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221395, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221395 BINDING SITE, designated SEQ ID:44184, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7237] Another function of VGAM51 is therefore inhibition of LOC221395 (Accession XM_166354). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221395. LOC256529 (Accession XM_174314) is another VGAM51 host target gene. LOC256529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC256529 BINDING SITE, designated SEQ ID:46588, to the nucleotide sequence of VGAM51 RNA, herein designated VGAM RNA, also designated SEQ ID:2762.

[7238] Another function of VGAM51 is therefore inhibition of LOC256529 (Accession XM_174314). Accordingly, utilities of VGAM51 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256529. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 52 (VGAM52) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7239] VGAM52 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM52 was detected is described hereinabove with reference to Figs. 1–8.

[7240] VGAM52 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7241] VGAM52 gene encodes a VGAM52 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM52 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM52 precursor RNA is designated SEQ ID:38, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:38 is located at position 109776 relative to the genome of Invertebrate Iridescent Virus 6.

[7242] VGAM52 precursor RNA folds onto itself, forming VGAM52 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7243] An enzyme complex designated DICER COMPLEX, `dices` the VGAM52 folded precursor RNA into VGAM52 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM52 RNA is designated SEQ ID:2763, and is provided hereinbelow with reference to the sequence listing part.

[7244] VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM52 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7245] VGAM52 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM52 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM52 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7246] The complementary binding of VGAM52 RNA, herein designated VGAM RNA, to host target binding sites on VGAM52 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM52 host target RNA into VGAM52 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7247] It is appreciated that VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM52 host target genes. The mRNA of each one of this plurality of VGAM52 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM52 RNA, herein designated VGAM RNA, and which when bound by VGAM52 RNA causes inhibition of translation of respective one or more VGAM52 host target proteins.

[7248] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM52 gene, herein designated VGAM GENE, on one or more VGAM52 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7249] It is yet further appreciated that a function of VGAM52 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM52 correlate with, and may be deduced from, the identity of the host target genes which VGAM52 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7250] Nucleotide sequences of the VGAM52 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM52 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM52 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM52 are further described hereinbelow with reference to Table 1.

[7251] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM52 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM52 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[7252] As mentioned hereinabove with reference to Fig. 1, a function of VGAM52 gene, herein designated VGAM is inhibition of expression of VGAM52 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM52 correlate with, and may be deduced from, the identity of the target genes which VGAM52 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7253] KIAA0205 (Accession NM_014873) is a VGAM52 host target gene. KIAA0205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0205 BINDING SITE, designated SEQ ID:17002, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:2763.

[7254] A function of VGAM52 is therefore inhibition of KIAA0205 (Accession NM_014873). Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with KIAA0205. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM52 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22389, to the nucleotide sequence of VGAM52 RNA, herein designated VGAM RNA, also designated SEQ ID:2763.

[7255] Another function of VGAM52 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM52 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 53 (VGAM53) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7256] VGAM53 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM53 was detected is described hereinabove with reference to Figs. 1–8.

[7257] VGAM53 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7258] VGAM53 gene encodes a VGAM53 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM53 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM53 precursor RNA is designated SEQ ID:39, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:39 is located at position 157900 relative to the genome of Invertebrate Iridescent Virus 6.

[7259] VGAM53 precursor RNA folds onto itself, forming VGAM53 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin struc-

ture`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7260] An enzyme complex designated DICER COMPLEX, `dices` the VGAM53 folded precursor RNA into VGAM53 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM53 RNA is designated SEQ ID:2764, and is provided hereinbelow with reference to the sequence listing part.

[7261] VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM53 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING

and 3`UTR respectively.

[7262] VGAM53 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM53 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM53 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7263] The complementary binding of VGAM53 RNA, herein des-

ignated VGAM RNA, to host target binding sites on VGAM53 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM53 host target RNA into VGAM53 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7264] It is appreciated that VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM53 host target genes. The mRNA of each one of this plurality of VGAM53 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM53 RNA, herein designated VGAM RNA, and which when bound by VGAM53 RNA causes inhibition of translation of respective one or more VGAM53 host target proteins.

[7265] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM53 gene, herein designated VGAM GENE, on one or more VGAM53 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known

non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7266] It is yet further appreciated that a function of VGAM53 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM53 correlate with, and may be deduced from, the identity of the host target genes which VGAM53 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7267] Nucleotide sequences of the VGAM53 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM53 RNA, herein designated VGAM RNA, and

a schematic representation of the secondary folding of VGAM53 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM53 are further described hereinbelow with reference to Table 1.

[7268] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM53 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM53 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7269] As mentioned hereinabove with reference to Fig. 1, a function of VGAM53 gene, herein designated VGAM is inhibition of expression of VGAM53 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM53 correlate with, and may be deduced from, the identity of the target genes which VGAM53 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7270] Aconitase 1, Soluble (ACO1, Accession NM_002197) is a VGAM53 host target gene. ACO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACO1, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACO1 BINDING SITE, designated SEQ ID:7954, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7271] A function of VGAM53 is therefore inhibition of Aconitase 1, Soluble (ACO1, Accession NM_002197), a gene which an iron-dependent enzyme; catalyzes conversion of citrate to cis-aconitate in the TCA cycle. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACO1. The function of ACO1 has been established by previous studies. Slaughter et al. (1975) reported that an electrophoretic survey had demonstrated 7 alleles at this locus. Among the populations studied, Nigerians showed polymorphism for ACON-S. Aconitase catalyzes the conversion of cis-aconitate to isocitrate. In studies of man-Chinese hamster somatic cell hybrids, Westerveld et al. (1975) showed that human gal-1-p uridyl transferase (GALT; 606999) and aconitase are syntenic. Eisenstein (2000) reviewed of the role of the iron regulatory proteins, IRP1 and IRP2 (OMIM Ref. No. 147582), and the molecular

control of mammalian iron metabolism. IRP1 is a bifunctional protein with mutually exclusive functions as an IRE RNA-binding protein or as the cytoplasmic isoform of aconitase. Aconitases are iron-sulfur proteins and a 4Fe-4S cluster is required for their enzymatic activity.

[7272] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7273] Slaughter, C. A.; Hopkinson, D. A.; Harris, H. : Aconitase polymorphism in man. *Ann. Hum. Genet.* 39: 193-202, 1975. ; and

[7274] Eisenstein, R. S. : Iron regulatory proteins and the molecular control of mammalian iron metabolism. *Annu. Rev. Nutr.* 20: 627-662, 2000.

[7275] Further studies establishing the function and utilities of ACO1 are found in John Hopkins OMIM database record ID 100880, and in cited publications numbered 181, 11582-183, 11882-805, 184, 806, 3401, 3780-186, 18 and 3864 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Attractin (ATRN, Accession NM_139321) is another VGAM53 host target gene. ATRN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by ATRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATRN BINDING SITE, designated SEQ ID:29300, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7276] Another function of VGAM53 is therefore inhibition of Attractin (ATRN, Accession NM_139321), a gene which is involved in the initial immune cell clustering during inflammatory response. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATRN. The function of ATRN has been established by previous studies. Attractin is a human serum glycoprotein that is rapidly expressed on activated T cells and released extracellularly after 48 to 72 hours. Duke-Cohan et al. (1998) cloned attractin and found that, as in its natural serum form, it mediates the spreading of monocytes that becomes the focus for the clustering of nonproliferating T lymphocytes. There are 2 mRNA species with hematopoietic tissue-specific expression that code for a 134-kD protein with a putative serine protease catalytic serine, 4 EGF-like motifs, a CUB do-

main, a C-type lectin domain, and a domain homologous with the ligand-binding region of the common gamma cytokine chain. Except for the last 2 domains, the overall structure shares high homology with a protein of *Caenorhabditis elegans*, suggesting that attractin has evolved new domains and functions in parallel with the development of cell-mediated immunity. When attractin was identified as the product of the murine 'mahogany' gene with connections to control of pigmentation and energy metabolism, and the 'mahogany' product was identified and shown to be a transmembrane protein, the possibility of a human membrane attractin in addition to the secreted form was raised. Tang et al. (2000) described the complete genomic sequence of attractin, focusing in particular on the exons coding for the 3-prime region, and showed how both human membrane and secreted attractin arise as a result of alternate splicing of the same gene. They found that soluble attractin arises from transcription of 25 sequential exons on 20p13, where the 3-prime terminal exon contains sequence from a long interspersed nuclear element-1 (OMIM Ref. No. LINE-1) retrotransposon insertion that includes a stop codon and a polyadenylation signal. The mRNA isoform for mem-

brane attraction splices over the LINE-1 exon and includes 5 exons encoding transmembrane and cytoplasmic domains with organization and coding potential almost identical to that of the mouse gene. The relative abundance of soluble and transmembrane isoforms measured by RT-PCR is differentially regulated in lymphoid tissues. Because activation of peripheral blood leukocytes with phytohemagglutinin induces strong expression of cell surface attractin followed by release of soluble attractin, these results suggested to Tang et al. (2000) that LINE-1 insertion, a genomic event unique to mammals, provided an evolutionarily mechanism for regulating cell interactions during an inflammatory reaction.

[7277] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7280] Further studies establishing the function and utilities of ATRN are found in John Hopkins OMIM database record ID 603130, and in cited publications numbered 648-65 and 5172 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deltex Homolog 1 (Drosophila) (DTX1, Accession NM_004416) is another VGAM53 host target gene. DTX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DTX1 BINDING SITE, designated SEQ ID:10679, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7281] Another function of VGAM53 is therefore inhibition of Deltex Homolog 1 (Drosophila) (DTX1, Accession NM_004416), a gene which modulates Notch signalling and bHLH transcription factor activity. Accordingly, utilities of VGAM53 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DTX1. The function of DTX1 has been established by previous studies. Using the yeast interaction trap system, Matsuno et al. (1998) found that *Drosophila* and human deltex bind to the human SH3-domain containing protein GRB2 (OMIM Ref. No. 108355). Results from 2 different reporter assays allowed them for the first time to associate deltex with Notch-dependent transcriptional events. They presented evidence linking deltex to the modulation of basic helix-loop-helix (bHLH) transcription factor activity. After confirming that DTX1 is expressed in T lymphocytes at all stages of development, Izon et al. (2002) showed by RT-PCR analysis that murine Dtx1 is also expressed in hemopoietic stem cells and in B lymphocytes in all stages of development, whereas Notch1 expression is low in these cells. The authors transduced hemopoietic progenitor cells with Dtx1 expressing green fluorescent protein and found that mice with these cells had a marked decrease in T cells in the thymus, peripheral blood, and spleen. Instead, the thymus in these mice and in organ culture displayed B-cell development resembling the phenotype of mice deficient in Notch1. Expression of DTX1 partially inhibited transactivation of a CSL (RBPSUH;

147183)-dependent luciferase reporter by activated intracellular NOTCH1 (ICN1) in human and mouse cells. The N terminus of DTX1, which directly interacts with the NOTCH1 ankyrin repeats, inhibited transactivation by ICN1 possessing the ankyrin repeats, probably by inhibiting recruitment of coactivators to the C-terminal transactivation domain of NOTCH1. Izon et al. (2002) concluded that DTX1 is an inhibitor of NOTCH1 activity, a conclusion earlier suggested by the studies of Sestan et al. (1999) on dendritic outgrowth from human neurons.

[7282] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7283] Izon, D. J.; Aster, J. C.; He, Y.; Weng, A.; Karnell, F. G.; Patriub, V.; Xu, L.; Bakkour, S.; Rodriguez, C.; Allman, D.; Pear, W. S. : Deltex1 redirects lymphoid progenitors to the B cell lineage by antagonizing Notch1. *Immunity* 16: 231-243, 2002. ; and

[7284] Matsuno, K.; Eastman, D.; Mitsiades, T.; Quinn, A. M.; Cancianu, M. L.; Ordentlich, P.; Kadesch, T.; Artavanis-Tsakonas, S. : Human deltex is a conserved regulator of Notch signalling.

[7285] Further studies establishing the function and utilities of

DTX1 are found in John Hopkins OMIM database record ID 602582, and in cited publications numbered 5735, 9040-904 and 12352 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300) is another VGAM53 host target gene. FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by FBXW1B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FBXW1B BINDING SITE1 through FBXW1B BINDING SITE3, designated SEQ ID:14664, SEQ ID:27366 and SEQ ID:27376 respectively, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7286] Another function of VGAM53 is therefore inhibition of F-box and WD-40 Domain Protein 1B (FBXW1B, Accession NM_012300), a gene which somehow is involved in the process of neuronal cell differentiation or brain development. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical condi-

tions associated with FBXW1B. The function of FBXW1B and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM25.GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491) is another VGAM53 host target gene. GAB2 BINDING SITE1 and GAB2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GAB2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAB2 BINDING SITE1 and GAB2 BINDING SITE2, designated SEQ ID:27846 and SEQ ID:34445 respectively, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7287] Another function of VGAM53 is therefore inhibition of GRB2-associated Binding Protein 2 (GAB2, Accession NM_080491), a gene which act as adapters for transmitting various signals. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAB2. The function of GAB2 has been established by previous studies. The GAB2

gene encodes a 100-kd adapter molecule that is the principal activator of phosphatidylinositol-3 kinase (PIK3; OMIM Ref. No. 171833) in response to activation of the high affinity IgE receptor (see OMIM Ref. No. 147140). Zhao et al. (1999) demonstrated that upon tyrosine phosphorylation, GAB2 physically interacts with SHP2 tyrosine phosphatase and GRB2 adapter protein (OMIM Ref. No. 604330). GAB2 has an inhibitory effect on the activation of ELK1 (OMIM Ref. No. 311040)-dependent transcription triggered by a dominant active Ras (OMIM Ref. No. 190020) mutant or under growth factor stimulation, whereas GAB1 acts to potentiate slightly the ELK1 activity in the same system. In contrast to the reciprocal effects of GAB1 and GAB2 in mediating ELK1 induction, these 2 molecules have a similar function in extracellular signal-regulated kinase activation induced by either oncogenic Ras or growth factor stimulation. Zhao et al. (1999) concluded that GAB1 and GAB2 may have distinct roles in coupling cytoplasmic-nuclear signal transduction. Animal model experiments lend further support to the function of GAB2. Gu et al. (2001) generated mice deficient in Gab2 by homologous recombination. Gab2 $-/-$ mice were viable and generally healthy; however, the response of Gab2 $-/-$

mast cells to stimulation of the high affinity IgE receptor Fc-epsilon-RI (see OMIM Ref. No. 147140) was defective. Accordingly, allergic reactions, such as passive cutaneous and systemic anaphylaxis, were markedly impaired in Gab^{-/-} mice. Biochemical analyses revealed that signaling pathways dependent on phosphatidylinositol-3 hydroxykinase (PI3K), a critical component of the Fc-epsilon-RI signaling, were defective in Gab2^{-/-} mast cells. Gu et al. (2001) concluded that GAB2 is the principal activator of PI3K in response to Fc-epsilon-RI activation, thereby providing genetic evidence that Dos/Gab family scaffolds regulate the PI3K pathway in vivo.

[7288] It is appreciated that the abovementioned animal model for GAB2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7289] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7290] Gu, H.; Saito, K.; Klamann, L. D.; Shen, J.; Fleming, T.; Wang, Y.-P.; Pratt, J. C.; Lin, G.; Lim, B.; Kinet, J.-P.; Neel, B. G. : Essential role for Gab2 in the allergic response. *Nature* 412: 186-190, 2001. ; and

- [7291] Zhao, C.; Yu, D.-H.; Shen, R.; Feng, G.-S. : Gab2, a new pleckstrin homology domain-containing adapter protein, acts to uncouple signaling from ERK kinase to Elk-1. J. Biol. Chem. 274.
- [7292] Further studies establishing the function and utilities of GAB2 are found in John Hopkins OMIM database record ID 606203, and in cited publications numbered 907, 673 and 7940 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023) is another VGAM53 host target gene. SH3BP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SH3BP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SH3BP2 BINDING SITE, designated SEQ ID:8949, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.
- [7293] Another function of VGAM53 is therefore inhibition of SH3-domain Binding Protein 2 (SH3BP2, Accession NM_003023). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with SH3BP2. SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029) is another VGAM53 host target gene. SHC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SHC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SHC1 BINDING SITE, designated SEQ ID:8971, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7294] Another function of VGAM53 is therefore inhibition of SHC (Src homology 2 domain containing) Transforming Protein 1 (SHC1, Accession NM_003029), a gene which couples activated growth factor receptors to a signaling pathway. Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SHC1. The function of SHC1 has been established by previous studies. Nemoto and Finkel (2002) observed that exposure to intracellular reactive oxygen species (ROS) induced an increase in phosphorylated Fkhrl1 (OMIM Ref. No. 602681) and a shift from a nuclear to a cytosolic localization. They found that serum starva-

tion, a stimulus that increases oxidative stress, resulted in lower levels of hydrogen peroxide in Shc1 $-/-$ cells or in cells expressing a ser36-to-ala (S36A) Shc1 mutant compared with wildtype cells. Serum starvation also increased Fkhrl1-dependent transcriptional activity, which was further augmented in the Shc1-deficient cells. Increased ROS exposure failed to induce increased Fkhrl1 phosphorylation in the mutant cells. Promoter analysis of the catalase (CAT; 115500) gene established the presence of FKHRL1-binding sequences. Reporter assays showed FKHRL1 transactivates CAT, suggesting a capacity to augment antioxidant scavenging. Nemoto and Finkel (2002) concluded that there is an important functional relationship between forkhead proteins (e.g., FKHRL1), SHC1, and intracellular oxidants, all of which are thought to be involved in the aging process in worms and mammals. Animal model experiments lend further support to the function of SHC1. Using transgenic Cre-lox-p-mediated inducible expression of a phosphorylation-defective Shc mutant and, alternatively, conditional deletion of the Shc gene in mouse thymocytes, Zhang et al. (2002) showed that both expression and tyrosine phosphorylation of Shc have essential roles in thymic T-cell development. They

also provided a concise summary of SHC biology.

[7295] It is appreciated that the abovementioned animal model for SHC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7296] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7297] Nemoto, S.; Finkel, T. : Redox regulation of forkhead proteins through a p66shc-dependent signaling pathway. Science 295: 2450–2452, 2002. ; and

[7298] Zhang, L.; Camerini, V.; Bender, T. P.; Ravichandran, K. S. : A nonredundant role for the adapter protein Shc in thymic T cell development. Nature Immun. 3: 749–755, 2002.

[7299] Further studies establishing the function and utilities of SHC1 are found in John Hopkins OMIM database record ID 600560, and in cited publications numbered 8158–8159, 50 and 8160–8165 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056) is another VGAM53 host target gene. SLC19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by SLC19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A1 BINDING SITE, designated SEQ ID:9022, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7300] Another function of VGAM53 is therefore inhibition of Solute Carrier Family 19 (folate transporter), Member 1 (SLC19A1, Accession NM_003056). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A1. ABLIM (Accession NM_002313) is another VGAM53 host target gene. ABLIM BINDING SITE1 and ABLIM BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ABLIM, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ABLIM BINDING SITE1 and ABLIM BINDING SITE2, designated SEQ ID:8116 and SEQ ID:13549 respectively, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7301] Another function of VGAM53 is therefore inhibition of ABLIM (Accession NM_002313). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABLIM. BICD2 (Accession XM_046863) is another VGAM53 host target gene. BICD2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BICD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BICD2 BINDING SITE, designated SEQ ID:34852, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7302] Another function of VGAM53 is therefore inhibition of BICD2 (Accession XM_046863). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BICD2. Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769) is another VGAM53 host target gene. CHST4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CHST4, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHST4 BINDING SITE, designated SEQ ID:12337, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7303] Another function of VGAM53 is therefore inhibition of Carbohydrate (N-acetylglucosamine 6-O) Sulfotransferase 4 (CHST4, Accession NM_005769). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHST4. DKFZP434I0714 (Accession XM_098247) is another VGAM53 host target gene. DKFZP434I0714 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434I0714, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434I0714 BINDING SITE, designated SEQ ID:41530, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7304] Another function of VGAM53 is therefore inhibition of DKFZP434I0714 (Accession XM_098247). Accordingly, utili-

ties of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434I0714. Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969) is another VGAM53 host target gene. EIF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5 BINDING SITE, designated SEQ ID:7701, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7305] Another function of VGAM53 is therefore inhibition of Eukaryotic Translation Initiation Factor 5 (EIF5, Accession NM_001969). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5. FLJ00001 (Accession XM_088525) is another VGAM53 host target gene. FLJ00001 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ00001, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FLJ00001 BINDING SITE, designated SEQ ID:39783, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7306] Another function of VGAM53 is therefore inhibition of FLJ00001 (Accession XM_088525). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00001. FLJ10101 (Accession NM_024718) is another VGAM53 host target gene. FLJ10101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10101 BINDING SITE, designated SEQ ID:24048, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7307] Another function of VGAM53 is therefore inhibition of FLJ10101 (Accession NM_024718). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10101. FLJ10209 (Accession NM_018026) is another VGAM53

host target gene. FLJ10209 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10209, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10209 BINDING SITE, designated SEQ ID:19769, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7308] Another function of VGAM53 is therefore inhibition of FLJ10209 (Accession NM_018026). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10209. FLJ20344 (Accession NM_017776) is another VGAM53 host target gene. FLJ20344 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20344, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20344 BINDING SITE, designated SEQ ID:19404, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7309] Another function of VGAM53 is therefore inhibition of FLJ20344 (Accession NM_017776). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20344. G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_057169) is another VGAM53 host target gene. GIT2 BINDING SITE1 through GIT2 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GIT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GIT2 BINDING SITE1 through GIT2 BINDING SITE3, designated SEQ ID:27687, SEQ ID:27700 and SEQ ID:16605 respectively, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7310] Another function of VGAM53 is therefore inhibition of G Protein-coupled Receptor Kinase-interactor 2 (GIT2, Accession NM_057169). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GIT2. KIAA0174 (Accession XM_085981) is another VGAM53 host target gene. KIAA0174 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by KIAA0174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0174 BINDING SITE, designated SEQ ID:38432, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7311] Another function of VGAM53 is therefore inhibition of KIAA0174 (Accession XM_085981). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0174. KIAA0562 (Accession NM_014704) is another VGAM53 host target gene. KIAA0562 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0562, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0562 BINDING SITE, designated SEQ ID:16243, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7312] Another function of VGAM53 is therefore inhibition of

KIAA0562 (Accession NM_014704). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0562. KIAA0652 (Accession NM_014741) is another VGAM53 host target gene. KIAA0652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0652 BINDING SITE, designated SEQ ID:16409, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7313] Another function of VGAM53 is therefore inhibition of KIAA0652 (Accession NM_014741). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0652. KIAA0876 (Accession XM_035625) is another VGAM53 host target gene. KIAA0876 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0876 BINDING SITE, designated SEQ ID:32299, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7314] Another function of VGAM53 is therefore inhibition of KIAA0876 (Accession XM_035625). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0876. KIAA0960 (Accession XM_166543) is another VGAM53 host target gene. KIAA0960 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0960, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0960 BINDING SITE, designated SEQ ID:44520, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7315] Another function of VGAM53 is therefore inhibition of KIAA0960 (Accession XM_166543). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0960. KIAA1303 (Accession XM_038376) is another

VGAM53 host target gene. KIAA1303 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1303, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1303 BINDING SITE, designated SEQ ID:32834, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7316] Another function of VGAM53 is therefore inhibition of KIAA1303 (Accession XM_038376). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1303. KIAA1423 (Accession XM_029703) is another VGAM53 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30920, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7317] Another function of VGAM53 is therefore inhibition of KIAA1423 (Accession XM_029703). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. KIAA1701 (Accession XM_042087) is another VGAM53 host target gene. KIAA1701 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1701, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1701 BINDING SITE, designated SEQ ID:33685, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7318] Another function of VGAM53 is therefore inhibition of KIAA1701 (Accession XM_042087). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1701. MGC16179 (Accession NM_032766) is another VGAM53 host target gene. MGC16179 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16179, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16179 BINDING SITE, designated SEQ ID:26514, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7319] Another function of VGAM53 is therefore inhibition of MGC16179 (Accession NM_032766). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16179. MKP-7 (Accession XM_039106) is another VGAM53 host target gene. MKP-7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MKP-7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKP-7 BINDING SITE, designated SEQ ID:33008, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7320] Another function of VGAM53 is therefore inhibition of MKP-7 (Accession XM_039106). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKP-7.

PRO1770 (Accession NM_014100) is another VGAM53 host target gene. PRO1770 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1770, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1770 BINDING SITE, designated SEQ ID:15326, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7321] Another function of VGAM53 is therefore inhibition of PRO1770 (Accession NM_014100). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1770. Rab11-FIP2 (Accession NM_014904) is another VGAM53 host target gene. Rab11-FIP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Rab11-FIP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Rab11-FIP2 BINDING SITE, designated SEQ ID:17097, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA,

also designated SEQ ID:2764.

[7322] Another function of VGAM53 is therefore inhibition of Rab11-FIP2 (Accession NM_014904). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Rab11-FIP2. UBX Domain Containing 2 (UBXD2, Accession XM_043196) is another VGAM53 host target gene. UBXD2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBXD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBXD2 BINDING SITE, designated SEQ ID:33913, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7323] Another function of VGAM53 is therefore inhibition of UBX Domain Containing 2 (UBXD2, Accession XM_043196). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBXD2. LOC147054 (Accession XM_097172) is another VGAM53 host target gene. LOC147054 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147054, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147054 BINDING SITE, designated SEQ ID:40792, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7324] Another function of VGAM53 is therefore inhibition of LOC147054 (Accession XM_097172). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147054. LOC154881 (Accession XM_088063) is another VGAM53 host target gene. LOC154881 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154881, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154881 BINDING SITE, designated SEQ ID:39497, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7325] Another function of VGAM53 is therefore inhibition of LOC154881 (Accession XM_088063). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC154881. LOC157858 (Accession XM_098833) is another VGAM53 host target gene. LOC157858 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157858, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157858 BINDING SITE, designated SEQ ID:41867, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7326] Another function of VGAM53 is therefore inhibition of LOC157858 (Accession XM_098833). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157858. LOC196047 (Accession XM_116883) is another VGAM53 host target gene. LOC196047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:43146, to

the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7327] Another function of VGAM53 is therefore inhibition of LOC196047 (Accession XM_116883). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196047. LOC253286 (Accession XM_174256) is another VGAM53 host target gene. LOC253286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253286 BINDING SITE, designated SEQ ID:46585, to the nucleotide sequence of VGAM53 RNA, herein designated VGAM RNA, also designated SEQ ID:2764.

[7328] Another function of VGAM53 is therefore inhibition of LOC253286 (Accession XM_174256). Accordingly, utilities of VGAM53 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253286. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 54 (VGAM54) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7329] VGAM54 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM54 was detected is described hereinabove with reference to Figs. 1–8.

[7330] VGAM54 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7331] VGAM54 gene encodes a VGAM54 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM54 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM54 precursor RNA is designated SEQ ID:40, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:40 is located at position 169568 relative to the genome of Invertebrate Iridescent Virus 6.

[7332] VGAM54 precursor RNA folds onto itself, forming VGAM54 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7333] An enzyme complex designated DICER COMPLEX, `dices` the VGAM54 folded precursor RNA into VGAM54 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 49%) nucleotide sequence of VGAM54 RNA is designated SEQ ID:2765, and is provided hereinbelow with reference to the sequence listing part.

[7334] VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM54 host target RNA, herein designated VGAM HOST

TARGET RNA. VGAM54 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7335] VGAM54 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM54 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM54 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region,

this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7336] The complementary binding of VGAM54 RNA, herein designated VGAM RNA, to host target binding sites on VGAM54 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM54 host target RNA into VGAM54 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7337] It is appreciated that VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM54 host target genes. The mRNA of each one of this plurality of VGAM54 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM54 RNA, herein designated VGAM RNA, and which when bound by VGAM54 RNA causes inhibition of translation of respective one or more VGAM54 host target proteins.

[7338] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM54 gene, herein designated VGAM GENE, on one or more VGAM54 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7339] It is yet further appreciated that a function of VGAM54 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM54 correlate with, and may be deduced from, the identity of the host target genes which VGAM54 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[7340] Nucleotide sequences of the VGAM54 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM54 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM54 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM54 are further described hereinbelow with reference to Table 1.

[7341] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM54 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM54 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7342] As mentioned hereinabove with reference to Fig. 1, a function of VGAM54 gene, herein designated VGAM is inhibition of expression of VGAM54 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM54 correlate with, and may be deduced from, the identity of the target genes which VGAM54 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7343] Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950) is a VGAM54 host target gene. PRRG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRRG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRRG1 BINDING SITE, designated SEQ ID:6653, to the nucleotide sequence of VGAM54 RNA, herein designated VGAM RNA, also designated SEQ ID:2765.

[7344] A function of VGAM54 is therefore inhibition of Proline-rich Gla (G-carboxyglutamic acid) Polypeptide 1 (PRRG1, Accession NM_000950). Accordingly, utilities of VGAM54 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRRG1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 55 (VGAM55) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7345] VGAM55 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM55 was detected is described hereinabove with reference to Figs. 1–8.

[7346] VGAM55 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7347] VGAM55 gene encodes a VGAM55 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM55 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM55 precursor RNA is designated SEQ ID:41, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:41 is located at position 37014 relative to the genome of Invertebrate Iridescent Virus 6.

[7348] VGAM55 precursor RNA folds onto itself, forming VGAM55 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7349] An enzyme complex designated DICER COMPLEX, `dices` the VGAM55 folded precursor RNA into VGAM55 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM55 RNA is designated SEQ ID:2766, and is provided hereinbelow with reference to the sequence listing part.

[7350] VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM55 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7351] VGAM55 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM55 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM55 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7352] The complementary binding of VGAM55 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM55 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM55 host target RNA into VGAM55 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7353] It is appreciated that VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM55 host target genes. The mRNA of each one of this plurality of VGAM55 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM55 RNA, herein designated VGAM RNA, and which when bound by VGAM55 RNA causes inhibition of translation of respective one or more VGAM55 host target proteins.

[7354] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM55 gene, herein designated VGAM GENE, on one or more VGAM55 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7355] It is yet further appreciated that a function of VGAM55 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM55 correlate with, and may be deduced from, the identity of the host target genes which VGAM55 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7356] Nucleotide sequences of the VGAM55 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM55 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM55 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM55 are further described hereinbelow with reference to Table 1.

[7357] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM55 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM55 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7358] As mentioned hereinabove with reference to Fig. 1, a function of VGAM55 gene, herein designated VGAM is inhibition of expression of VGAM55 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM55 correlate with, and may be deduced from, the identity of the target genes which VGAM55 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7359] Aristaless-like Homeobox 3 (ALX3, Accession NM_006492) is a VGAM55 host target gene. ALX3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALX3, corresponding to a HOST TARGET binding site such as BINDING SITE

I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALX3 BINDING SITE, designated SEQ ID:13221, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7360] A function of VGAM55 is therefore inhibition of Arista-less-like Homeobox 3 (ALX3, Accession NM_006492), a gene which is involved in cell-type differentiation and development. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALX3. The function of ALX3 has been established by previous studies. Homeo box genes encode transcriptional regulators involved in cell-type differentiation and development. To identify beta-cell homeodomain proteins, Rudnick et al. (1994) designed primers based on the sequences of the beta-cell homeo box genes cdx3 (OMIM Ref. No. 600297), Imx1 (OMIM Ref. No. 600298), and the Drosophila homeodomain protein Antennapedia to amplify inserts by PCR from a hamster insulinoma cDNA library (HIT). One of the genes identified showed homology to the Drosophila gene aristaless and was designated Alx3. Alx3 encodes a paired (prd) class homeodomain protein that shares high sequence homol-

ogy with another member of this subclass, *cart1* (OMIM Ref. No. 601527), not only in the homeodomain but also in the region between the homeodomain and the C terminus. In addition to HIT cells, *Alx3* was expressed in a mouse pancreatic exocrine cell line and was abundant in pancreatic exocrine cells. Ten Berge et al. (1998) cloned a full-length mouse *Alx3* cDNA encoding a 343-amino acid protein. *Alx3* belongs to the large class of genes that encode a prd/Q50 homeodomain, denoting moderate similarity to the prd homeodomain but the presence of a glutamine at position 50. The authors found that *Alx3* was expressed in mouse embryos from 8 days of gestation onward in a characteristic pattern, predominantly in neural crest-derived mesenchyme and in lateral plate mesoderm. Prominent expression was seen in the frontonasal head mesenchyme and in the first and second pharyngeal arches and some of their derivatives. High expression was also seen in the tail and in many derivatives of the lateral plate mesoderm including the limbs, the body wall, and the genital tubercle. By interspecific backcross analysis, ten Berge et al. (1998) mapped the mouse *Alx3* gene to chromosome 3 in close proximity to the droopy-ear mutation (*de*). The International Radiation Hybrid Mapping

Consortium mapped the human ALX3 gene to chromosome 1p21-p13 (stSG24507

[7361] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7362] Rudnick, A.; Ling, T. Y.; Odagiri, H.; Rutter, W. J.; German, M. S. : Pancreatic beta cells express a diverse set of homeobox genes. Proc. Nat. Acad. Sci. 91: 12203-12207, 1994. ; and

[7363] ten Berge, D.; Brouwer, A.; El Bahi, S.; Guenet, J.-L.; Robert, B.; Meijlink, F. : Mouse Alx3: an aristaless-like homeobox gene expressed during embryogenesis in ectomesenchyme and late.

[7364] Further studies establishing the function and utilities of ALX3 are found in John Hopkins OMIM database record ID 606014, and in cited publications numbered 6336-6337 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174) is another VGAM55 host target gene. ARHGAP6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ARHGAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGAP6 BINDING SITE, designated SEQ ID:6848, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7365] Another function of VGAM55 is therefore inhibition of Rho GTPase Activating Protein 6 (ARHGAP6, Accession NM_001174), a gene which activates the rho-type GTPases by converting them to an inactive GTP-bound state. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGAP6. The function of ARHGAP6 has been established by previous studies. In a search for the genetic defect in microphthalmia with linear skin defects syndrome (MLS; 309801), Schaefer et al. (1997) trapped exons from 14 overlapping cosmids from the 500-kb MLS critical region in Xp22.3. Using exon connection followed by cDNA library screening, they identified a 2.4-kb contig of cDNA clones spanning 170 kb of genomic sequence in the MLS deletion region. Northern analysis of this cDNA detected a prominent transcript of approximately 4.2 kb and a less abundant transcript of approximately 6 kb in all tissues examined, with additional transcripts in skeletal

muscle. Sequence analysis revealed a coding region of 601 amino acids contained in 12 exons, with a splice variant isoform of 495 amino acids. The predicted protein sequence of the gene, symbolized ARHGAP6, contains homology to the GTPase-activating (GAP) domain of the Rho-GAP family of proteins (e.g., 300023), which has been implicated in the regulation of actin polymerization at the plasma membrane in several cellular processes. Schaefer et al. (1997) discussed reasons for thinking that a defect in the Rho pathway may play a role in the pathogenesis of MLS syndrome. Prakash et al. (2000) investigated the function of ARHGAP6 by generating Arhgap6 null mice and also by in vitro expression studies. Surprisingly, loss of the rhoGAP function of Arhgap6 did not cause any detectable phenotypic or behavioral abnormalities in the mutant mice. Transfected mammalian cells expressing ARHGAP6 lost their actin stress fibers, retracted from the growth surface, and extended thin, branching processes resembling filopodia. The ARHGAP6 protein colocalized with actin filaments through an N-terminal domain and recruited filamentous actin into the growing processes. Mutation of a conserved arginine residue in the rhoGAP domain prevented the loss of stress fibers but had

little effect on process outgrowth. The authors concluded that ARHGAP6 has 2 independent functions: one as a GAP with specificity for RhoA and the other as a cytoskeletal protein that promotes actin remodeling.

[7366] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7367] Prakash, S. K.; Paylor, R.; Jenna, S.; Lamarche-Vane, N.; Armstrong, D. L.; Xu, B.; Mancini, M. A.; Zoghbi, H. Y. : Functional analysis of ARHGAP6, a novel GTPase-activating protein for RhoA. Hum. Molec. Genet. 9: 477-488, 2000. ; and

[7368] Schaefer, L.; Prakash, S.; Zoghbi, H. Y. : Cloning and characterization of a novel rho-type GTPase-activating protein gene (ARHGAP6) from the critical region for microphthalmia with li.

[7369] Further studies establishing the function and utilities of ARHGAP6 are found in John Hopkins OMIM database record ID 300118, and in cited publications numbered 10628-10629 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963) is another

VGAM55 host target gene. ARHGEF6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF6 BINDING SITE, designated SEQ ID:33842, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7370] Another function of VGAM55 is therefore inhibition of Rac/Cdc42 Guanine Nucleotide Exchange Factor (GEF) 6 (ARHGEF6, Accession XM_042963). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF6. Activating Transcription Factor 7 (ATF7, Accession NM_006856) is another VGAM55 host target gene. ATF7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATF7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATF7 BINDING SITE, designated SEQ ID:13726, to the nucleotide sequence of VGAM55 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2766.

[7371] Another function of VGAM55 is therefore inhibition of Activating Transcription Factor 7 (ATF7, Accession NM_006856). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATF7. HLA-B Associated Transcript 1 (BAT1, Accession NM_004640) is another VGAM55 host target gene. BAT1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by BAT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAT1 BINDING SITE, designated SEQ ID:11015, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7372] Another function of VGAM55 is therefore inhibition of HLA-B Associated Transcript 1 (BAT1, Accession NM_004640), a gene which associates with the major histocompatibility complex, a negative regulator of inflammation. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAT1. The function of BAT1 has

been established by previous studies. Peelman et al. (1995) sequenced both human and pig BAT1 and showed that the genes are members of the DEAD-box family of ATP-dependent RNA helicases, members of which are involved in a number of cellular functions including initiation of translation, RNA splicing, and ribosome assembly. Proteins of this family have 9 conserved amino acid motifs but differ at their amino and carboxyl ends. From studies of other family members, the first block is involved in ATP binding, the fifth block may be an ATPase, the sixth block is needed for RNA helicase activity, and the ninth block is involved with ATP hydrolysis-independent RNA interactions during unwinding. The gene contains 10 exons spanning about 10 kb of genomic DNA and encodes a 428-amino acid protein. Peelman et al. (1995) detected 3 different length mRNAs (4.1, 17, and 0.9 kb) in all tissues analyzed, although at different relative levels. The protein is highly conserved, with 98% identity to the p47 rat liver nuclear protein and 99% identity to the pig BAT1 homolog. Furthermore, the location of BAT1 at the telomeric end of the class III region is conserved in both humans and pig. Peelman et al. (1995) showed that a recombinant epitope-tagged BAT1 construct was expressed in COS cells and

showed localization of the protein to the nucleus. Allcock et al. (2001) used antisense DNA corresponding to exons 2 through 5 of the BAT1 gene and showed that after antigenic stimulation, monocytic and T-cell lines produced higher levels of the acute phase cytokines TNF, interleukin-1 (IL1; OMIM Ref. No. 147760), and IL6 (OMIM Ref. No. 147620) than cells containing the transfecting vector alone. These results suggested that BAT1 is a negative regulator of inflammation.

[7373] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7374] Peelman, L. J.; Chardon, P.; Nunes, M.; Renard, C.; Gefrotin, C.; Vaiman, M.; Van Zeveren, A.; Coppieters, W.; van de Weghe, A.; Bouquet, Y.; Choy, W. W.; Strominger, J. L.; Spies, T. : The BAT1 gene in the MHC encodes an evolutionarily conserved putative nuclear RNA helicase of the DEAD family. *Genomics* 26: 210–218, 1995. ; and

[7375] Allcock, R. J. N.; Williams, J. H.; Price, P. : The central MHC gene, BAT1, may encode a protein that down-regulates cytokine production. *Genes Cells* 6: 487–494, 2001.

[7376] Further studies establishing the function and utilities of BAT1 are found in John Hopkins OMIM database record ID

142560, and in cited publications numbered 3541–3545 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. CD34 Antigen (CD34, Accession NM_001773) is another VGAM55 host target gene. CD34 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD34, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD34 BINDING SITE, designated SEQ ID:7532, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7377] Another function of VGAM55 is therefore inhibition of CD34 Antigen (CD34, Accession NM_001773), a gene which is a monomeric cell surface antigen that is selectively expressed on human hematopoietic progenitor cells. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD34. The function of CD34 has been established by previous studies. CD34 is a monomeric cell surface antigen with a molecular mass of approximately 110 kD that is selectively expressed on human

hematopoietic progenitor cells. In the hands of Sutherland et al. (1988), partial amino acid analysis of highly purified CD34 antigen revealed no significant sequence similarity with any previously described structures. Sequential immunoprecipitation and Western blot analysis indicated that this antigen is not a member of the leukosialin/sialophorin family, despite the fact that these molecules share several structural similarities. Animal model experiments lend further support to the function of CD34. To analyze the involvement of CD34 in hematopoiesis, Cheng et al. (1996) produced both embryonic stem (ES) cells in mice null for the expression of this mucin. Analysis of yolk sac-like hematopoietic development in embryoid bodies derived from CD34-null ES cells showed a significant delay in both erythroid and myeloid differentiation that could be reversed by transfection of the mutant ES cells with CD34 constructs expressing either a complete or truncated cytoplasmic domain. In spite of these diminished embryonic hematopoietic progenitor numbers, the CD34-null mice developed normally, and the hematopoietic profile of adult blood appeared typical. However, the colony-forming activity of hematopoietic progenitors derived from both bone marrow and spleen was significantly

reduced in adult CD34-deficient animals.

[7378] It is appreciated that the abovementioned animal model for CD34 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7379] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7380] Cheng, J.; Baumhueter, S.; Cacalano, G.; Carver-Moore, K.; Thibodeaux, H.; Thomas, R.; Broxmeyer, H. E.; Cooper, S.; Hague, N.; Moore, M.; Lasky, L. A. : Hematopoietic defects in mice lacking the sialomucin CD34. Blood 87: 479-490, 1996. ; and

[7381] Sutherland, D. R.; Watt, S. M.; Dowden, G.; Karhi, K.; Baker, M. A.; Greaves, M. F.; Smart, J. E. : Structural and partial amino acid sequence analysis of the human hemopoietic progenitor.

[7382] Further studies establishing the function and utilities of CD34 are found in John Hopkins OMIM database record ID 142230, and in cited publications numbered 2673-2681 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2,

Accession NM_006482) is another VGAM55 host target gene. DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DYRK2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DYRK2 BINDING SITE1 and DYRK2 BINDING SITE2, designated SEQ ID:13210 and SEQ ID:9635 respectively, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7383] Another function of VGAM55 is therefore inhibition of Dual-specificity tyrosine-(Y)-phosphorylation Regulated Kinase 2 (DYRK2, Accession NM_006482). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DYRK2. Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473) is another VGAM55 host target gene. FOXE1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FOXE1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FOXE1 BINDING SITE, designated SEQ ID:10785, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7384] Another function of VGAM55 is therefore inhibition of Forkhead Box E1 (thyroid transcription factor 2) (FOXE1, Accession NM_004473). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FOXE1. Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376) is another VGAM55 host target gene. GRINL1A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRINL1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRINL1A BINDING SITE, designated SEQ ID:34446, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7385] Another function of VGAM55 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate-like 1A (GRINL1A, Accession XM_045376), a gene

which plays a role in the development and function of the mammalian brain. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRINL1A. The function of GRINL1A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM53. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is another VGAM55 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38416, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7386] Another function of VGAM55 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with GRLF1. The function of GRLF1 has been established by previous studies. Using polyclonal antibodies against purified GRLF1, LeClerc et al. (1991) isolated a partial GRLF1 cDNA encoding a deduced 835-amino acid protein. The protein contains 3 possible zinc finger structures and a leucine zipper motif that contains 1 cysteine. Western blot analysis detected expression of a 94-kD GRLF1 protein. By sequence comparisons with rat p190A, database searching, and RT-PCR analysis, Tikoo et al. (2000) obtained a full-length cDNA sequence encoding GRLF1, the human homolog of p190A. The deduced 1,514-amino acid protein is 97% identical to the rat sequence. The first 1,287 residues, including the GTPase and middle domains, are encoded by the 3.7-kb exon 1, similar to the structure observed in p190B (ARHGAP5; 602680).

[7387] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7388] LeClerc, S.; Palaniswami, R.; Xie, B.; Govdan, M. V. : Molecular cloning and characterization of a factor that binds the human glucocorticoid receptor gene and represses its expression. J. Biol. Chem. 266: 17333-17340, 1991. ; and

- [7389] Tikoo, A.; Czekay, S.; Viars, C.; White, S.; Heath, J. K.; Arden, K.; Maruta, H. : p190-A, a human tumor suppressor gene, maps to the chromosomal region 19q13.3 that is reportedly delet.
- [7390] Further studies establishing the function and utilities of GRLF1 are found in John Hopkins OMIM database record ID 605277, and in cited publications numbered 6613–6614 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Lipoprotein Lipase (LPL, Accession NM_000237) is another VGAM55 host target gene. LPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPL BINDING SITE, designated SEQ ID:5752, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.
- [7391] Another function of VGAM55 is therefore inhibition of Lipoprotein Lipase (LPL, Accession NM_000237), a gene which is the hydrolysis of triglycerides of circulating chylomicrons and very low density lipoproteins (vldl). the en-

zyme functions in the presence of apolipoprotein c-2 on the luminal surface of vascular. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPL. The function of LPL has been established by previous studies. Holt et al. (1939) first reported the familial occurrence of this syndrome. Boggs et al. (1957) described 3 affected sibs from a first-cousin mating. Massive hyperchylomicronemia occurs when the patient is on a normal diet and disappears completely in a few days on fat-free feeding. On a normal diet alpha and beta lipoproteins are low. A defect in removal of chylomicrons (fat induction) and of other triglyceride-rich lipoproteins (carbohydrate induction) is present. Decreased plasma postheparin lipolytic activity (PHLA) is demonstrated. Low tissue activity of lipoprotein lipase was suspected. The full-blown disease, manifested by attacks of abdominal pain, hepatosplenomegaly, eruptive xanthomas, and lactescence of the plasma, is a recessive. Heterozygotes may show slight hyperlipemia and reduced PHLA. Precocious atherosclerosis does not seem to be a feature. Havel and Gordon (1960) first recognized deficiency of lipoprotein lipase (triacylglycerol acylhydrolase; EC 3.1.1.3) as the basic de-

fect in type I hyperlipoproteinemia. The type I hyperlipoproteinemia phenotype can also result from deficiency of the activator of lipoprotein lipase, apolipoprotein C-II (Breckenridge et al., 1978)--see 207750. This condition was called fat-induced hypertriglyceridemia by Nevin and Slack (1968). Adipose tissue in heterozygotes shows intermediate levels of lipoprotein lipase. Berger (1987) reported a case of variant lipoprotein lipase deficiency in which muscle lipoprotein lipase was essentially normal although the enzyme in adipose tissue was markedly reduced. Schreibman et al. (1973) studied a family with 2 clinically typical sibs whose lipoprotein lipase showed abnormal substrate specificity and kinetics. Hoeg et al. (1983) reported an extraordinary patient in whom the diagnosis was first made at the age of 75. Absolute abstinence from alcohol and a self-imposed low-fat diet may have been responsible for the long survival. Since childhood, he had had recurrent abdominal pain, nausea and vomiting, diagnosed as 'gall bladder attacks,' until age 48 when he was first hospitalized. During the next 15 years he had 1 to 3 episodes of abdominal pain per year necessitating hospitalization. These episodes were diagnosed as acute pancreatitis and were sometimes associated with

an evanescent papular rash. Jaundice that developed rapidly at age 64 was found to be due to bile duct stenosis, which was surgically relieved. He had, at age 73, ischemic heart disease and a femoral bruit. Animal model experiments lend further support to the function of LPL. To study the effects of increased free fatty acid (FFA) uptake in muscle tissue, Levak-Frank et al. (1995) generated transgenic mice carrying a human LPL minigene driven by the promoter of the muscle creatine kinase gene (OMIM Ref. No. 123310). In these mice, human LPL was expressed in skeletal muscle and cardiac muscle, but not in other tissues. In 3 independent transgenic mouse lines, the authors detected decreased plasma triglyceride levels, elevated FFA uptake by muscle tissue, weight loss, and premature death in proportion to the level of LPL overexpression. The animals developed severe myopathy characterized by muscle fiber degeneration, fiber atrophy, glycogen storage, and extensive proliferation of mitochondria and peroxisomes. The extensive proliferation suggested to Levak-Frank et al. (1995) that FFA plays an important role in the biogenesis of these organelles. The experiments indicated that LPL is rate-limiting for the supply of muscle tissue with triglyceride-derived FFA. The

authors concluded that improper regulation of muscle LPL can lead to major pathologic changes and may be important in the pathogenesis of some human myopathies

[7392] It is appreciated that the abovementioned animal model for LPL is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7393] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7394] Berger, G. M. B. : An incomplete form of familial lipoprotein lipase deficiency presenting with type I hyperlipoproteinemia. *Am. J. Clin. Path.* 88: 369–373, 1987. ; and

[7395] Levak–Frank, S.; Radner, H.; Walsh, A.; Stollberger, R.; Knipping, G.; Hoefler, G.; Sattler, W.; Weinstock, P. H.; Breslow, J. L.; Zechner, R. : Muscle–specific overexpression of lipoprot.

[7396] Further studies establishing the function and utilities of LPL are found in John Hopkins OMIM database record ID 238600, and in cited publications numbered 3301–3304, 3473–3320, 1866, 11733–11735, 11661, 11736–11741, 3300, 11742–11757, 3321–3323, 4211, 8952–8954, 8958–8956, 8959, 8960–8969, 9234–8971, 9236–8974,

9235, 9408, 9416–9419, 11382–943 and 36 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Melanoma Antigen, Family B, 4 (MAGEB4, Accession NM_002367) is another VGAM55 host target gene. MAGEB4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAGEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAGEB4 BINDING SITE, designated SEQ ID:8175, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7397] Another function of VGAM55 is therefore inhibition of Melanoma Antigen, Family B, 4 (MAGEB4, Accession NM_002367). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAGEB4. Mitogen-activated Protein Kinase Kinase Kinase 14 (MAP3K14, Accession NM_003954) is another VGAM55 host target gene. MAP3K14 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP3K14, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP3K14 BINDING SITE, designated SEQ ID:10090, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7398] Another function of VGAM55 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 14 (MAP3K14, Accession NM_003954), a gene which is involved in the activation of nf-kappa-b and its transcriptional activity. induces the processing of nf-kappa-b 2/p100. could act in a receptor-selective manner (by similarity). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP3K14. The function of MAP3K14 has been established by previous studies. By functional analysis of NIK and a kinase-deficient NIK expressed in primary human cells and in inflamed rheumatoid arthritis tissue, Smith et al. (2001) showed that NIK has a selective role in signaling by the lymphotoxin-beta receptor (LTBR; 600979). They determined that NIK is not required for signaling in response to lipopolysaccharide, IL1, and TNFA and is not a generic IKK kinase Animal model experiments

lend further support to the function of MAP3K14. The alymphoplasia (aly) mutation of mouse is autosomal recessive and characterized by the systemic absence of lymph nodes and Peyer patches and disorganized splenic and thymic structures with immunodeficiency. Shinkura et al. (1999) cloned the mouse Nik gene and determined that a G-to-A transition leads to a gly855-to-arg substitution in the C terminus of the protein, causing alymphoplasia in aly/aly mice

[7399] It is appreciated that the abovementioned animal model for MAP3K14 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7400] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7401] Shinkura, R.; Kitada, K.; Matsuda, F.; Tashiro, K.; Ikuta, K.; Suzuki, M.; Kogishi, K.; Serikawa, T.; Honjo, T. : Alymphoplasia is caused by a point mutation in the mouse gene encoding Nf-kappa-b-inducing kinase. Nature Genet. 22: 74-77, 1999. ; and

[7402] Smith, C.; Andreakos, E.; Crawley, J. B.; Brennan, F. M.; Feldmann, M.; Foxwell, B. M. J. : NF-kappa-B-inducing ki-

nase is dispensable for activation of NF-kappa-B in inflammatory setting.

[7403] Further studies establishing the function and utilities of MAP3K14 are found in John Hopkins OMIM database record ID 604655, and in cited publications numbered 7279, 1274 and 8178-7283 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355) is another VGAM55 host target gene. MPP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MPP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MPP2 BINDING SITE, designated SEQ ID:30081, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7404] Another function of VGAM55 is therefore inhibition of Membrane Protein, Palmitoylated 2 (MAGUK p55 subfamily member 2) (MPP2, Accession XM_008355). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with MPP2. Mucin 3B (MUC3B, Accession XM_168578) is another VGAM55 host target gene. MUC3B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MUC3B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MUC3B BINDING SITE, designated SEQ ID:45258, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7405] Another function of VGAM55 is therefore inhibition of Mucin 3B (MUC3B, Accession XM_168578), a gene which provides a protective, lubricating barrier against particles and infectious agents at mucosal surfaces. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MUC3B. The function of MUC3B has been established by previous studies. The MUC3A gene (OMIM Ref. No. 158371), originally designated MUC3, encodes a trans-membrane mucin-type glycoprotein. A number of consistent single nucleotide changes were observed in different MUC3 cDNAs from a single individual, suggesting the presence of at least 3 different transcripts. Pratt et al.

(2000) presented evidence that this transcript heterogeneity is due to the existence of allelic changes and to tandem duplication of the MUC3 gene. Pratt et al. (2000) determined that the second gene, which they designated MUC3B, has the same C-terminal domain and intron-exon structure as that previously described for MUC3. The tandem repeat domain has the same amino acid consensus sequence but shows more substitutions. RT-PCR detected expression of MUC3B in fetal and adult small intestine, fetal and adult colon, and Caco-2 cells. Kyo et al. (2001) also determined that 'MUC3' consists of 2 genes, MUC3A and MUC3B, both of which encode membrane-bound mucins with 2 epidermal growth factor-like motifs and a putative transmembrane region. Fox et al. (1992) mapped the MUC3 gene (now MUC3A and MUC3B) to chromosome 7q22 by in situ hybridization.

[7406] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7407] Fox, M. F.; Lahbib, F.; Pratt, W.; Attwood, J.; Gum, J.; Kim, Y.; Swallow, D. M. : Regional localization of the intestinal mucin gene MUC3 to chromosome 7q22. *Ann. Hum. Genet.* 56: 281-287, 1992. ; and

[7408] Kyo, K.; Muto, T.; Nagawa, H.; Lathrop, G. M.; Nakamura, Y. : Associations of distinct variants of the intestinal mucin gene MUC3A with ulcerative colitis and Crohn's disease. J. Hum. G.

[7409] Further studies establishing the function and utilities of MUC3B are found in John Hopkins OMIM database record ID 605633, and in cited publications numbered 5195–519 and 4502 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nucleoporin 98kDa (NUP98, Accession NM_016320) is another VGAM55 host target gene. NUP98 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUP98, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUP98 BINDING SITE, designated SEQ ID:18441, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7410] Another function of VGAM55 is therefore inhibition of Nucleoporin 98kDa (NUP98, Accession NM_016320), a gene which functions in the nuclear transport of protein and RNA. Accordingly, utilities of VGAM55 include diagnosis,

prevention and treatment of diseases and clinical conditions associated with NUP98. The function of NUP98 has been established by previous studies. Nucleoporins are proteins that function in the nuclear transport of protein and RNA. Nakamura et al. (1996) showed that in 3 patients with t(7;11), the chromosome rearrangement created a genomic fusion between the HOXA9 gene (OMIM Ref. No. 142956) and the nucleoporin gene NUP98 on 11p15. Expression of Hoxa7 and Hoxa9 is activated by proviral integration in BXH2 murine myeloid leukemias; this result, combined with the mapping of the HOXA cluster to 7p15, suggested that one of the HOXA genes may be involved in the human t(7;11)(p15;p15) translocation found in some myeloid leukemia patients. The translocation produced an invariant chimeric NUP98/HOXA9 transcript containing the amino terminal half of NUP98 fused in-frame to HOXA9. These studies identified HOXA9 as an important human myeloid leukemia gene and suggested an important role for nucleoporins in human myeloid leukemia, given that a second nucleoporin, NUP214 (OMIM Ref. No. 114350), had also been implicated in human myeloid leukemia. The 11p15 gene was identified by exon trapping experiments. Borrow et al. (1996) likewise iden-

tified the HOXA9 and NUP98 genes as the parents of the fusion in t(7;11)(p15;p15) in acute myeloid leukemia of the FABM2 and M4 types. Borrow et al. (1996) suggested that the predicted NUP98/HOXA9 fusion protein may promote leukemogenesis through inhibition of HOXA9-mediated terminal differentiation and/or aberrant nucleocytoplasmic transport.

[7411] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7412] Borrow, J.; Shearman, A. M.; Stanton, V. P., Jr.; Becher, R.; Collins, T.; Williams, A. J.; Dube, I.; Katz, F.; Kwong, Y. L.; Morris, C.; Ohyashiki, K.; Toyama, K.; Rowley, J.; Housman, D. E. : The t(7;11)(p15;p15) translocation in acute myeloid leukaemia fuses the genes for nucleoporin NUP98 and class I homeoprotein HOXA9. *Nature Genet.* 12: 159–167, 1996. ; and

[7413] Nakamura, T.; Largaespada, D. A.; Lee, M. P.; Johnson, L. A.; Ohyashiki, K.; Toyama, K.; Chen, S. J.; Willman, C. L.; Chen, I.-M.; Feinberg, A. P.; Jenkins, N. A.; Copeland, N. G.; Shau.

[7414] Further studies establishing the function and utilities of NUP98 are found in John Hopkins OMIM database record

ID 601021, and in cited publications numbered 3689, 9642, 9643–9646, 2723, 9647–965 and 10957–9653 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430) is another VGAM55 host target gene. PAFAH1B1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAFAH1B1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PAFAH1B1 BINDING SITE, designated SEQ ID:6009, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7415] Another function of VGAM55 is therefore inhibition of Platelet-activating Factor Acetylhydrolase, Isoform Ib, Alpha Subunit 45kDa (PAFAH1B1, Accession NM_000430). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAFAH1B1. Peripheral Myelin Protein 2 (PMP2, Accession NM_002677) is another VGAM55 host target gene. PMP2 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by PMP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMP2 BINDING SITE, designated SEQ ID:8544, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7416] Another function of VGAM55 is therefore inhibition of Peripheral Myelin Protein 2 (PMP2, Accession NM_002677), a gene which is a lipid transport protein in schwann cells. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP2. The function of PMP2 has been established by previous studies. Myelin is a multilamellar compacted membrane structure that surrounds and insulates axons, facilitating the conduction of nerve impulses. It is composed predominantly of lipids, with proteins accounting for about 30% of its net weight. Schwann cells are responsible for myelin formation in the peripheral nervous system. Peripheral myelin protein-2 (PMP2), a small basic protein, is one of the major proteins of peripheral myelin and appears to be related to the transport

of fatty acids or the metabolism of myelin lipids. Hayasaka et al. (1991) noted that PMP2 (which they also called myelin P2 protein, MP2) was shown to have lipid-binding activity. Thus, MP2 protein may have an important role in the organization of compact myelin. Hayasaka et al. (1991) isolated a full-length cDNA of MP2 protein of peripheral myelin from a cDNA library of human fetus spinal cord. It was found to contain a 393-bp open reading frame encoding a polypeptide of 131 residues. The deduced amino acid sequence is highly homologous to myelin P2 protein from other species. Hayasaka et al. (1993) cloned the genomic PMP2 sequence, which is about 8 kb long and consists of 4 exons. All exon-intron junction sequences conform to the GT/AG rule. The 5-prime flanking region of the gene has a TA-rich element (TATA-like box) and a single defined transcription initiation site as detected by the primer extension method. By spot-blot hybridization (FISH) of flow-sorted human chromosomes and fluorescence in situ hybridization, Hayasaka et al. (1993) mapped the PMP2 gene to 8q21.3-q22.1. This is the same region as that in which the autosomal recessive form of Charcot-Marie-Tooth peroneal muscular atrophy (CMT4A; 214400) has been mapped. Thus, the

PMP2 gene was a prime candidate for the site of the mutation in that disorder.

[7417] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7418] Hayasaka, K.; Nanao, K.; Tahara, M.; Sato, W.; Takada, G.; Miura, M.; Uyemura, K. : Isolation and sequence determination of cDNA encoding P2 protein of human peripheral myelin. *Biochem. Biophys. Res. Commun.* 181: 204–207, 1991. ; and

[7419] Hayasaka, K.; Himoro, M.; Takada, G.; Takahashi, E.; Minoshima, S.; Shimizu, N. : Structure and localization of the gene encoding human peripheral myelin protein 2 (PMP2). *Genomics* 18: 244–.

[7420] Further studies establishing the function and utilities of PMP2 are found in John Hopkins OMIM database record ID 170715, and in cited publications numbered 10814–10817 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449) is another VGAM55 host target gene. RFX5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region

of mRNA encoded by RFX5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RFX5 BINDING SITE, designated SEQ ID:6046, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7421] Another function of VGAM55 is therefore inhibition of Regulatory Factor X, 5 (influences HLA class II expression) (RFX5, Accession NM_000449), a gene which activates transcription from class ii mhc promoters. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RFX5. The function of RFX5 has been established by previous studies. Major histocompatibility complex (MHC) class II molecules are heterodimeric transmembrane glycoproteins consisting of alpha and beta chains. In man, there are 3 MHC class II isotypes: HLA-DR, -DP, and -DQ. MHC class II molecules play a key role in the immune system. They present exogenous antigenic peptides to the receptor of CD4+ T-helper lymphocytes, thereby triggering the antigen-specific T-cell activation events required for the initiation and sustenance of immune responses.

Durand et al. (1997) noted that the crucial role in the control of the immune response is exemplified by the finding that ectopic or aberrantly high levels of MHC class II expression is associated with autoimmune diseases, while a lack of MHC class II expression results in a severe immunodeficiency syndrome called MHC class II deficiency, or the bare lymphocyte syndrome type II (BLS; 209920). At least 4 complementation groups have been identified in B-cell lines established from patients with BLS. The molecular defect responsible for complementation group A resides in the gene encoding CIITA (MHC2TA; 600005). CIITA is a non-DNA-binding transactivator that functions as a molecular switch controlling both cell-type-specific and inducible MHC class II gene transcription. In contrast, the defects in complementation groups B, C, and D all lead to a deficiency in RFX, a nuclear protein complex that binds to the X box of MHC class II promoters (see OMIM Ref. No. RFX2; 142765). The lack of RFX binding activity in complementation group C results from mutations in the gene encoding the 75-kD subunit of RFX (Steimle et al., 1995). This gene was called RFX5 because it is the fifth member of the growing family of DNA-binding proteins sharing a novel and highly characteristic DNA-binding do-

main called the RFX motif. Nekrep et al. (2000) demonstrated a direct interaction between the C terminus of RFXAP (OMIM Ref. No. 601861) and RFXANK (OMIM Ref. No. 603200); mutant RFXAP or RFXANK proteins failed to bind. The authors found that RFX5 binds only to the RFXANK–RFXAP scaffold and not to either protein alone. However, neither the scaffold nor RFX5 alone can bind DNA. Nekrep et al. (2000) concluded that the binding of the RFXANK–RFXAP scaffold to RFX5 leads to a conformational change in the latter that exposes the DNA-binding domain of RFX5. The DNA-binding domain of RFX5 anchors the RFX complex to MHC class II X and S promoter boxes. Another part of the RFX5 protein interacts with MHC2TA. The authors pointed out that mutation of either protein in complementation group B or group D of BLS patients prevents its binding to the other protein, explaining why MHC class II promoters are bare in the bare lymphocyte syndrome.

[7422] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7423] Durand, B.; Sperisen, P.; Emery, P.; Barras, E.; Zufferey, M.; Mach, B.; Reith, W. : RFXAP, a novel subunit of the RFX

DNA binding complex is mutated in MHC class II deficiency. EMBO J. 16: 1045–1055, 1997. ; and

[7424] Nekrep, N.; Jabrane–Ferrat, N.; Peterlin, B. M. : Mutations in the bare lymphocyte syndrome define critical steps in the assembly of the regulatory factor X complex. Molec. Cell Biol. 2.

[7425] Further studies establishing the function and utilities of RFX5 are found in John Hopkins OMIM database record ID 601863, and in cited publications numbered 753, 5800, 8320, 5807, 8319, 626 and 12618 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ring Finger Protein 4 (RNF4, Accession NM_002938) is another VGAM55 host target gene. RNF4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RNF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF4 BINDING SITE, designated SEQ ID:8839, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7426] Another function of VGAM55 is therefore inhibition of Ring Finger Protein 4 (RNF4, Accession NM_002938). Ac–

cordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF4. Sal-like 1 (Drosophila) (SALL1, Accession NM_002968) is another VGAM55 host target gene. SALL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SALL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SALL1 BINDING SITE, designated SEQ ID:8878, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7427] Another function of VGAM55 is therefore inhibition of Sal-like 1 (Drosophila) (SALL1, Accession NM_002968). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SALL1. Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544) is another VGAM55 host target gene. TAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TAP2 BINDING SITE, designated SEQ ID:6142, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7428] Another function of VGAM55 is therefore inhibition of Transporter 2, ATP-binding Cassette, Sub-family B (MDR/TAP) (TAP2, Accession NM_000544), a gene which is involved in the transport of antigens from the cytoplasm to a membrane-bound compartment for association with mhc class i molecules. Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAP2. The function of TAP2 has been established by previous studies. Various studies have identified genes within the major histocompatibility complex (MHC) that play a role in presentation of antigenic peptides to T cells. RING4 (TAP1), a gene within the human MHC class II region, was found to have sequence homology with members of the ABC (ATP-binding cassette) transporter superfamily. Powis et al. (1992) reported the nucleotide sequence of RING11, a second ABC transporter gene located approximately 7 kb telomeric to RING4. RING11, or TAP2, was found to be gamma-interferon (OMIM Ref. No. 147570) inducible, a property

shared with other genes involved in antigen presentation. A comparison between the predicted amino acid sequences of RING11 and RING4 showed strong homology. Powis et al. (1992) proposed that the 2 gene products form a heterodimer that transports peptides from the cytoplasm into the endoplasmic reticulum. They identified 2 RING11 alleles that differ in the length of their derived protein sequence by 17 amino acids. The more common of these alleles had a frequency of 79% in a Caucasoid population. Both TAP1 and TAP2 polypeptides possess a nucleotide-binding domain (NBD). Karttunen et al. (2001) presented biochemical and functional evidence that the NBDs of TAP1 and TAP2 are nonequivalent. Photolabeling experiments with 8-azido-ATP demonstrated a cooperative interaction between the 2 NBDs that can be stimulated by peptide. The substitution of key lysine residues in the Walker A motifs of TAP1 and TAP2 suggested that TAP1-mediated ATP hydrolysis is not essential for peptide translocation but that TAP2-mediated ATP hydrolysis is critical, not only for translocation, but for peptide binding.

[7429] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [7430] Karttunen, J. T.; Lehner, P. J.; Gupta, S. S.; Hewitt, E. W.; Cresswell, P. : Distinct functions and cooperative interaction of the subunits of the transporter associated with antigen processing (TAP). Proc. Nat. Acad. Sci. 98: 7431–7436, 2001. ; and
- [7431] Powis, S. H.; Mockridge, I.; Kelly, A.; Kerr, L.–A.; Glynn, R.; Gileadi, U.; Beck, S.; Trowsdale, J. : Polymorphism in a second ABC transporter gene located within the class II region.
- [7432] Further studies establishing the function and utilities of TAP2 are found in John Hopkins OMIM database record ID 170261, and in cited publications numbered 1945, 1948–1951, 194 and 1952 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Usher Syndrome 3A (USH3A, Accession NM_052995) is another VGAM55 host target gene. USH3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by USH3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of USH3A BINDING SITE, designated SEQ ID:27560, to the nucleotide sequence of VGAM55 RNA, herein designated

VGAM RNA, also designated SEQ ID:2766.

[7433] Another function of VGAM55 is therefore inhibition of Usher Syndrome 3A (USH3A, Accession NM_052995). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with USH3A. 24432 (Accession NM_022914) is another VGAM55 host target gene. 24432 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by 24432, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of 24432 BINDING SITE, designated SEQ ID:23225, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7434] Another function of VGAM55 is therefore inhibition of 24432 (Accession NM_022914). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with 24432. BOP (Accession XM_097915) is another VGAM55 host target gene. BOP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BOP, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:41210, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7435] Another function of VGAM55 is therefore inhibition of BOP (Accession XM_097915). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP. Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576) is another VGAM55 host target gene. C5orf7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf7 BINDING SITE, designated SEQ ID:31942, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7436] Another function of VGAM55 is therefore inhibition of Chromosome 5 Open Reading Frame 7 (C5orf7, Accession XM_033576). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with C5orf7. Chromosome 6 Open Reading Frame 26 (C6orf26, Accession NM_025259) is another VGAM55 host target gene. C6orf26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C6orf26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C6orf26 BINDING SITE, designated SEQ ID:24928, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7437] Another function of VGAM55 is therefore inhibition of Chromosome 6 Open Reading Frame 26 (C6orf26, Accession NM_025259). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C6orf26. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM55 host target gene. CHRAC1 BINDING SITE1 and CHRAC1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CHRAC1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the

nucleotide sequences of CHRAC1 BINDING SITE1 and CHRAC1 BINDING SITE2, designated SEQ ID:18902 and SEQ ID:18903 respectively, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7438] Another function of VGAM55 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. DT1P1A10 (Accession XM_029187) is another VGAM55 host target gene.

DT1P1A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DT1P1A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DT1P1A10 BINDING SITE, designated SEQ ID:30859, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7439] Another function of VGAM55 is therefore inhibition of DT1P1A10 (Accession XM_029187). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with DT1P1A10. FK506 Binding Protein 4, 59kDa (FKBP4, Accession NM_002014) is another VGAM55 host target gene. FKBP4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP4 BINDING SITE, designated SEQ ID:7754, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7440] Another function of VGAM55 is therefore inhibition of FK506 Binding Protein 4, 59kDa (FKBP4, Accession NM_002014). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKBP4. FLJ11539 (Accession NM_024748) is another VGAM55 host target gene. FLJ11539 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11539, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11539 BINDING SITE, designated SEQ

ID:24086, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7441] Another function of VGAM55 is therefore inhibition of FLJ11539 (Accession NM_024748). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11539. FLJ14735 (Accession NM_032832) is another VGAM55 host target gene. FLJ14735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14735 BINDING SITE, designated SEQ ID:26607, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7442] Another function of VGAM55 is therefore inhibition of FLJ14735 (Accession NM_032832). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14735. FLJ14950 (Accession NM_032865) is another VGAM55 host target gene. FLJ14950 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26677, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7443] Another function of VGAM55 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ20079 (Accession NM_017656) is another VGAM55 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19177, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7444] Another function of VGAM55 is therefore inhibition of

FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ21596 (Accession NM_024823) is another VGAM55 host target gene. FLJ21596 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ21596, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21596 BINDING SITE, designated SEQ ID:24214, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7445] Another function of VGAM55 is therefore inhibition of FLJ21596 (Accession NM_024823). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21596. FLJ22195 (Accession NM_022758) is another VGAM55 host target gene. FLJ22195 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22195, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ22195 BINDING SITE, designated SEQ ID:22997, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7446] Another function of VGAM55 is therefore inhibition of FLJ22195 (Accession NM_022758). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22195. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM55 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:22689, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7447] Another function of VGAM55 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with GOLPH3. KIAA0295 (Accession XM_042833) is another VGAM55 host target gene. KIAA0295 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0295 BINDING SITE, designated SEQ ID:33779, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7448] Another function of VGAM55 is therefore inhibition of KIAA0295 (Accession XM_042833). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0295. KIAA0599 (Accession XM_085127) is another VGAM55 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37855, to the

nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7449] Another function of VGAM55 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0825 (Accession XM_027906) is another VGAM55 host target gene. KIAA0825 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0825, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0825 BINDING SITE, designated SEQ ID:30594, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7450] Another function of VGAM55 is therefore inhibition of KIAA0825 (Accession XM_027906). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0825. KIAA1030 (Accession XM_167789) is another VGAM55 host target gene. KIAA1030 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA1030, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1030 BINDING SITE, designated SEQ ID:44822, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7451] Another function of VGAM55 is therefore inhibition of KIAA1030 (Accession XM_167789). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1030. KIAA1126 (Accession XM_050325) is another VGAM55 host target gene. KIAA1126 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1126, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1126 BINDING SITE, designated SEQ ID:35610, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7452] Another function of VGAM55 is therefore inhibition of KIAA1126 (Accession XM_050325). Accordingly, utilities

of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1126. KIAA1464 (Accession XM_043069) is another VGAM55 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33887, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7453] Another function of VGAM55 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1464. KIAA1535 (Accession XM_086565) is another VGAM55 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1535 BINDING SITE, designated SEQ ID:38767, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7454] Another function of VGAM55 is therefore inhibition of KIAA1535 (Accession XM_086565). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. KIAA1536 (Accession NM_020898) is another VGAM55 host target gene. KIAA1536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1536 BINDING SITE, designated SEQ ID:21923, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7455] Another function of VGAM55 is therefore inhibition of KIAA1536 (Accession NM_020898). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1536. KIAA1655 (Accession XM_039442) is another VGAM55 host target gene. KIAA1655 BINDING SITE is

HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1655, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1655 BINDING SITE, designated SEQ ID:33084, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7456] Another function of VGAM55 is therefore inhibition of KIAA1655 (Accession XM_039442). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1655. KIAA1805 (Accession XM_086976) is another VGAM55 host target gene. KIAA1805 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1805, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1805 BINDING SITE, designated SEQ ID:38999, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7457] Another function of VGAM55 is therefore inhibition of

KIAA1805 (Accession XM_086976). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1805. Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM_031988) is another VGAM55 host target gene. MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAP2K6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP2K6 BINDING SITE1 and MAP2K6 BINDING SITE2, designated SEQ ID:25701 and SEQ ID:8642 respectively, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7458] Another function of VGAM55 is therefore inhibition of Mitogen-activated Protein Kinase Kinase 6 (MAP2K6, Accession NM_031988). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP2K6. Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540) is another VGAM55 host target gene. NCOA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by NCOA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NCOA2 BINDING SITE, designated SEQ ID:13294, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7459] Another function of VGAM55 is therefore inhibition of Nuclear Receptor Coactivator 2 (NCOA2, Accession NM_006540). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NCOA2. Solute Carrier Family 38, Member 5 (SLC38A5, Accession NM_033518) is another VGAM55 host target gene. SLC38A5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC38A5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A5 BINDING SITE, designated SEQ ID:27296, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7460] Another function of VGAM55 is therefore inhibition of So-

lute Carrier Family 38, Member 5 (SLC38A5, Accession NM_033518). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A5. Target of Myb1 (chicken) (TOM1, Accession NM_005488) is another VGAM55 host target gene. TOM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TOM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TOM1 BINDING SITE, designated SEQ ID:11985, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7461] Another function of VGAM55 is therefore inhibition of Target of Myb1 (chicken) (TOM1, Accession NM_005488). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TOM1. Tweety Homolog 2 (Drosophila) (TTYH2, Accession NM_032646) is another VGAM55 host target gene. TTYH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TTYH2, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TTYH2 BINDING SITE, designated SEQ ID:26379, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7462] Another function of VGAM55 is therefore inhibition of Tweety Homolog 2 (Drosophila) (TTYH2, Accession NM_032646). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TTYH2. UDP Glycosyltransferase 2 Family, Polypeptide B10 (UGT2B10, Accession NM_001075) is another VGAM55 host target gene. UGT2B10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGT2B10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGT2B10 BINDING SITE, designated SEQ ID:6736, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7463] Another function of VGAM55 is therefore inhibition of UDP

Glycosyltransferase 2 Family, Polypeptide B10 (UGT2B10, Accession NM_001075). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGT2B10. Zinc Finger Protein 238 (ZNF238, Accession NM_006352) is another VGAM55 host target gene. ZNF238 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF238 BINDING SITE, designated SEQ ID:13043, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7464] Another function of VGAM55 is therefore inhibition of Zinc Finger Protein 238 (ZNF238, Accession NM_006352). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF238. LOC144893 (Accession XM_096687) is another VGAM55 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40462, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7465] Another function of VGAM55 is therefore inhibition of LOC144893 (Accession XM_096687). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC147042 (Accession XM_097167) is another VGAM55 host target gene. LOC147042 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147042, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147042 BINDING SITE, designated SEQ ID:40787, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7466] Another function of VGAM55 is therefore inhibition of LOC147042 (Accession XM_097167). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC147042. LOC147093 (Accession XM_097184) is another VGAM55 host target gene. LOC147093 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC147093, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147093 BINDING SITE, designated SEQ ID:40805, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7467] Another function of VGAM55 is therefore inhibition of LOC147093 (Accession XM_097184). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147093. LOC147645 (Accession XM_085831) is another VGAM55 host target gene. LOC147645 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC147645, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147645 BINDING SITE, designated SEQ ID:38360, to

the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7468] Another function of VGAM55 is therefore inhibition of LOC147645 (Accession XM_085831). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147645. LOC150299 (Accession XM_097869) is another VGAM55 host target gene. LOC150299 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150299, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150299 BINDING SITE, designated SEQ ID:41181, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7469] Another function of VGAM55 is therefore inhibition of LOC150299 (Accession XM_097869). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150299. LOC151647 (Accession XM_087261) is another VGAM55 host target gene. LOC151647 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC151647, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151647 BINDING SITE, designated SEQ ID:39157, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7470] Another function of VGAM55 is therefore inhibition of LOC151647 (Accession XM_087261). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151647. LOC152274 (Accession XM_087418) is another VGAM55 host target gene. LOC152274 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152274, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152274 BINDING SITE, designated SEQ ID:39236, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7471] Another function of VGAM55 is therefore inhibition of LOC152274 (Accession XM_087418). Accordingly, utilities

of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152274. LOC152275 (Accession XM_098186) is another VGAM55 host target gene. LOC152275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152275 BINDING SITE, designated SEQ ID:41459, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7472] Another function of VGAM55 is therefore inhibition of LOC152275 (Accession XM_098186). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152275. LOC152313 (Accession XM_098190) is another VGAM55 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC152313 BINDING SITE, designated SEQ ID:41473, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7473] Another function of VGAM55 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC153196 (Accession XM_098323) is another VGAM55 host target gene. LOC153196 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC153196, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153196 BINDING SITE, designated SEQ ID:41592, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7474] Another function of VGAM55 is therefore inhibition of LOC153196 (Accession XM_098323). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153196. LOC157909 (Accession XM_088419) is another VGAM55 host target gene. LOC157909 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157909 BINDING SITE, designated SEQ ID:39679, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7475] Another function of VGAM55 is therefore inhibition of LOC157909 (Accession XM_088419). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157909. LOC158450 (Accession XM_088580) is another VGAM55 host target gene. LOC158450 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158450, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158450 BINDING SITE, designated SEQ ID:39844, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7476] Another function of VGAM55 is therefore inhibition of

LOC158450 (Accession XM_088580). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158450. LOC158504 (Accession XM_088591) is another VGAM55 host target gene. LOC158504 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158504, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158504 BINDING SITE, designated SEQ ID:39855, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7477] Another function of VGAM55 is therefore inhibition of LOC158504 (Accession XM_088591). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158504. LOC200205 (Accession XM_114152) is another VGAM55 host target gene. LOC200205 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200205, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC200205 BINDING SITE, designated SEQ ID:42735, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7478] Another function of VGAM55 is therefore inhibition of LOC200205 (Accession XM_114152). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200205. LOC200261 (Accession XM_114172) is another VGAM55 host target gene. LOC200261 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200261, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200261 BINDING SITE, designated SEQ ID:42749, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7479] Another function of VGAM55 is therefore inhibition of LOC200261 (Accession XM_114172). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200261. LOC222662 (Accession XM_167086) is an-

other VGAM55 host target gene. LOC222662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222662 BINDING SITE, designated SEQ ID:44602, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7480] Another function of VGAM55 is therefore inhibition of LOC222662 (Accession XM_167086). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222662. LOC254556 (Accession XM_170588) is another VGAM55 host target gene. LOC254556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254556 BINDING SITE, designated SEQ ID:45392, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7481] Another function of VGAM55 is therefore inhibition of LOC254556 (Accession XM_170588). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254556. LOC254707 (Accession XM_173687) is another VGAM55 host target gene. LOC254707 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254707, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254707 BINDING SITE, designated SEQ ID:46554, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7482] Another function of VGAM55 is therefore inhibition of LOC254707 (Accession XM_173687). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254707. LOC257612 (Accession XM_175270) is another VGAM55 host target gene. LOC257612 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC257612, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257612 BINDING SITE, designated SEQ ID:46740, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7483] Another function of VGAM55 is therefore inhibition of LOC257612 (Accession XM_175270). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257612. LOC51652 (Accession NM_016079) is another VGAM55 host target gene. LOC51652 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51652, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51652 BINDING SITE, designated SEQ ID:18152, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7484] Another function of VGAM55 is therefore inhibition of LOC51652 (Accession NM_016079). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC51652. LOC90520 (Accession XM_032277) is another VGAM55 host target gene. LOC90520 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90520, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90520 BINDING SITE, designated SEQ ID:31631, to the nucleotide sequence of VGAM55 RNA, herein designated VGAM RNA, also designated SEQ ID:2766.

[7485] Another function of VGAM55 is therefore inhibition of LOC90520 (Accession XM_032277). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90520. LOC91050 (Accession XM_035703) is another VGAM55 host target gene. LOC91050 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91050, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91050 BINDING SITE, designated SEQ ID:32339, to the nucleotide sequence of VGAM55 RNA, herein designated

VGAM RNA, also designated SEQ ID:2766.

[7486] Another function of VGAM55 is therefore inhibition of LOC91050 (Accession XM_035703). Accordingly, utilities of VGAM55 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91050. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 56 (VGAM56) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7487] VGAM56 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM56 was detected is described hereinabove with reference to Figs. 1–8.

[7488] VGAM56 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7489] VGAM56 gene encodes a VGAM56 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM56 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM56 precursor RNA is designated SEQ ID:42, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:42 is located at position 116893 relative to the genome of Invertebrate Iridescent Virus 6.

[7490] VGAM56 precursor RNA folds onto itself, forming VGAM56 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7491] An enzyme complex designated DICER COMPLEX, `dices` the VGAM56 folded precursor RNA into VGAM56 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM56 RNA is designated SEQ ID:2767, and is provided hereinbelow with reference to the sequence listing part.

[7492] VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM56 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7493] VGAM56 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM56 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM56 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7494] The complementary binding of VGAM56 RNA, herein designated VGAM RNA, to host target binding sites on VGAM56 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM56 host target RNA into VGAM56 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7495] It is appreciated that VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM56 host target genes. The mRNA of each one of this plurality of VGAM56 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM56 RNA, herein designated VGAM RNA, and which when bound by VGAM56 RNA causes inhibition of translation of respective one or more VGAM56 host target proteins.

[7496] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM56 gene, herein designated VGAM GENE, on one or more VGAM56 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7497] It is yet further appreciated that a function of VGAM56 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM56 correlate with, and may be deduced from, the identity of the host target genes which VGAM56 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7498] Nucleotide sequences of the VGAM56 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM56 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM56 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM56 are further described hereinbelow with reference to Table 1.

[7499] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM56 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM56 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7500] As mentioned hereinabove with reference to Fig. 1, a function of VGAM56 gene, herein designated VGAM is inhibition of expression of VGAM56 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM56 correlate with, and may be deduced from, the identity of the target genes which VGAM56 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7501] Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM_098859) is a VGAM56 host target gene. C9orf14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by C9orf14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf14 BINDING SITE, designated SEQ ID:41908, to the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:2767.

[7502] A function of VGAM56 is therefore inhibition of Chromosome 9 Open Reading Frame 14 (C9orf14, Accession XM_098859). Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical

conditions associated with C9orf14. LOC143187 (Accession NM_145206) is another VGAM56 host target gene. LOC143187 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143187, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143187 BINDING SITE, designated SEQ ID:29745, to the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:2767.

[7503] Another function of VGAM56 is therefore inhibition of LOC143187 (Accession NM_145206). Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143187. LOC158332 (Accession XM_088554) is another VGAM56 host target gene. LOC158332 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC158332, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158332 BINDING SITE, designated SEQ ID:39824, to

the nucleotide sequence of VGAM56 RNA, herein designated VGAM RNA, also designated SEQ ID:2767.

[7504] Another function of VGAM56 is therefore inhibition of LOC158332 (Accession XM_088554). Accordingly, utilities of VGAM56 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158332. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 57 (VGAM57) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7505] VGAM57 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM57 was detected is described hereinabove with reference to Figs. 1–8.

[7506] VGAM57 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7507] VGAM57 gene encodes a VGAM57 precursor RNA, herein

designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM57 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM57 precursor RNA is designated SEQ ID:43, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:43 is located at position 14382 relative to the genome of Invertebrate Iridescent Virus 6.

[7508] VGAM57 precursor RNA folds onto itself, forming VGAM57 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7509] An enzyme complex designated DICER COMPLEX, `dices` the VGAM57 folded precursor RNA into VGAM57 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM57 RNA is designated SEQ ID:2768, and is provided hereinbelow with reference to the sequence listing part.

[7510] VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM57 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7511] VGAM57 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM57 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, desig-

nated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM57 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7512] The complementary binding of VGAM57 RNA, herein designated VGAM RNA, to host target binding sites on VGAM57 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM57 host target RNA into VGAM57 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7513] It is appreciated that VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM57 host target genes. The mRNA of

each one of this plurality of VGAM57 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM57 RNA, herein designated VGAM RNA, and which when bound by VGAM57 RNA causes inhibition of translation of respective one or more VGAM57 host target proteins.

[7514] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM57 gene, herein designated VGAM GENE, on one or more VGAM57 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7515] It is yet further appreciated that a function of VGAM57 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM57 correlate with, and may be deduced from, the identity of the host target genes which VGAM57 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7516] Nucleotide sequences of the VGAM57 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM57 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM57 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM57 are further described hereinbelow with reference to Table 1.

[7517] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM57 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM57 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[7518] As mentioned hereinabove with reference to Fig. 1, a function of VGAM57 gene, herein designated VGAM is inhibition of expression of VGAM57 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM57 correlate with, and may be deduced from, the identity of the target genes which VGAM57 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7519] Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082) is a VGAM57 host target gene. CKN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CKN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CKN1 BINDING SITE, designated SEQ ID:5533, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7520] A function of VGAM57 is therefore inhibition of Cockayne Syndrome 1 (classical) (CKN1, Accession NM_000082). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with CKN1. Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423) is another VGAM57 host target gene. DVL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DVL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DVL3 BINDING SITE, designated SEQ ID:10699, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7521] Another function of VGAM57 is therefore inhibition of Dishevelled, Dsh Homolog 3 (Drosophila) (DVL3, Accession NM_004423), a gene which regulates cell proliferation. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DVL3. The function of DVL3 has been established by previous studies. The Drosophila dishevelled gene (*dsh*) encodes a cytoplasmic phosphoprotein (Klingensmith et al., 1994) that regulates cell proliferation, acting as a transducer molecule for developmental processes, including segmentation and neuroblast specification. Pizzuti et al. (1996) noted that *dsh* is required for

the function of the wingless gene product wg, a segment polarity gene homologous to the mammalian protooncogene WNT1 (OMIM Ref. No. 164820). Pizzuti et al. (1996) reported the isolation and chromosomal mapping of 2 human dsh homologs, designated DVL1 (OMIM Ref. No. 601365) and DVL3 by them. The human dsh homologs were isolated from a fetal brain cDNA library. DVL3 encodes a predicted 716-amino acid polypeptide that shows 74% nucleotide homology with human DVL1 and 71% homology with the mouse Dvl1 gene. DVL1 and DVL3 share 64% amino acid identity. Pizzuti et al. (1996) reported that homology is particularly high in the N-terminal region and that there is more divergence in the C-terminal regions. PCR carried out using DNA from rodent human somatic cell hybrids and DVL3 specific primers led to the assignment of DVL3 to human chromosome 3. Pizzuti et al. (1996) regionally assigned DVL3 to band 3q27 using fluorescence in situ hybridization. Hybridization of poly(A) mRNA with the DVL3 cDNA revealed a 2.9-kb transcript with abundant expression in skeletal muscle, pancreas and heart. They also detected 5.9-kb and 5.0-kb transcripts in skeletal muscle, adult liver, adult heart, pancreas, and placenta. The 5.9-kb form was abundant in fe-

tal tissues but the 5.0-kb form was absent from these tissues. Pizzuti et al. (1996) noted that Charcot-Marie-Tooth type 2B (OMIM Ref. No. 600882) maps to chromosome 3q. Bui et al. (1997) also isolated human DVL3, which shares 98% amino acid identity with mouse Dvl3 and 49% with *Drosophila dsh*. The authors confirmed the chromosomal localization at 3p27. Semenov and Snyder (1997) isolated 3 human genes encoding proteins homologous to *Drosophila dsh*. The cDNA sequence of DVL3 reported by Semenov and Snyder (1997) differs from the previously reported sequences deposited in GenBank. Bui et al. (1997) detected expression of DVL3 mRNA in B cells, breast, kidney, bladder, endometrium, and 2 primary endometrial cultures. It was detected equally in normal human breast tissues and tumors and in colorectal samples of normal tissues, polyps, and tumors.

[7522] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7523] Pizzuti, A.; Amati, F.; Calabrese, G.; Mari, A.; Colosimo, A; Silani, V.; Giardino, L.; Ratti, A.; Penso, D.; Calza, L.; Palka, G.; Scarlato, G.; Novelli, G.; Dallapiccola, B. : cDNA characterization and chromosomal mapping of two human ho-

mologs of the Drosophila dishevelled polarity gene. Hum. Molec. Genet. 5: 953–958, 1996. ; and

[7524] Semenov, M. V.; Snyder, M. : Human dishevelled genes constitute a DHR-containing multigene family. Genomics 42: 302–310, 1997.

[7525] Further studies establishing the function and utilities of DVL3 are found in John Hopkins OMIM database record ID 601368, and in cited publications numbered 9864–6902 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Epidermal Growth Factor (beta-urogastrone) (EGF, Accession NM_001963) is another VGAM57 host target gene. EGF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EGF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EGF BINDING SITE, designated SEQ ID:7688, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7526] Another function of VGAM57 is therefore inhibition of Epidermal Growth Factor (beta-urogastrone) (EGF, Accession NM_001963), a gene which stimulates the growth of epi-

dermal and epithelial tissues and of some fibroblasts in cell culture. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EGF. The function of EGF has been established by previous studies. During the immediate-early response of mammalian cells to mitogens, histone H3 (see OMIM Ref. No. 601128) is rapidly and transiently phosphorylated by one or more kinases. Sassone-Corsi et al. (1999) demonstrated that EGF-stimulated phosphorylation of H3 requires RSK2 (OMIM Ref. No. 300075), a member of the pp90(RSK) family of kinases implicated in growth control. Looking for the genetic factors that mediate susceptibility to, and outcome of, sporadic malignant melanoma, Shahbazi et al. (2002) focused on epidermal growth factor because of its role in mitogenesis. They tested for genetic polymorphisms in EGF in 135 white European patients with malignant melanoma and in 99 healthy white European controls. They identified a single-nucleotide substitution, G to A, at position 61 of the EGF gene. Frequencies of the A and G alleles of EGF were 56% and 44%, respectively, in controls. Cells from individuals homozygous for the 61A allele produced significantly less EGF than cells from 61G homozygotes or A/G

heterozygotes. Compared with the A/A genotype, G/G was significantly associated with risk of malignant melanoma (odds ratio 4.9, p less than 0.0001).

[7527] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7528] Sassone-Corsi, P.; Mizzen, C. A.; Cheung, P.; Crosjo, C.; Monaco, L.; Jacquot, S.; Hanauer, A.; Allis, C. D. : Requirement of Rsk-2 for epidermal growth factor-activated phosphorylation of histone H3. Science 285: 886-891, 1999. ; and

[7529] Shahbazi, M.; Pravica, V.; Nasreen, N.; Fakhoury, H.; Fryer, A. A.; Strange, R. C.; Hutchinson, P. E.; Osborne, J. E.; Lear, J. T.; Smith, A. G.; Hutchinson, I. V. : Association between.

[7530] Further studies establishing the function and utilities of EGF are found in John Hopkins OMIM database record ID 131530, and in cited publications numbered 4631-4644 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ellis Van Creveld Syndrome (EVC, Accession NM_014556) is another VGAM57 host target gene. EVC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by EVC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVC BINDING SITE, designated SEQ ID:15885, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7531] Another function of VGAM57 is therefore inhibition of Ellis Van Creveld Syndrome (EVC, Accession NM_014556). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVC. Eve, Even-skipped Homeo Box Homolog 1 (Drosophila) (EVX1, Accession NM_001989) is another VGAM57 host target gene. EVX1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by EVX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EVX1 BINDING SITE, designated SEQ ID:7713, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7532] Another function of VGAM57 is therefore inhibition of Eve,

Even-skipped Homeo Box Homolog 1 (Drosophila) (EVX1, Accession NM_001989). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EVX1. Fanconi Anemia, Complementation Group E (FANCE, Accession NM_021922) is another VGAM57 host target gene. FANCE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FANCE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FANCE BINDING SITE, designated SEQ ID:22447, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7533] Another function of VGAM57 is therefore inhibition of Fanconi Anemia, Complementation Group E (FANCE, Accession NM_021922), a gene which is a possible regulator of lymphocyte and platelet function. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FANCE. The function of FANCE has been established by previous studies. A number sign (#) is used with this entry because Fanconi anemia is caused by mutation in 1 of the Fanconi

anemia complementation group genes: FANCA (OMIM Ref. No. 607139), FANCB (OMIM Ref. No. 227660), FANCC (OMIM Ref. No. 227645), FANCD1 (OMIM Ref. No. 605724), FANCD2 (OMIM Ref. No. 227646), FANCE (OMIM Ref. No. 600901), FANCF (OMIM Ref. No. 603467), FANCG (OMIM Ref. No. 602956). The previously designated FANCH complementation group (Joenje et al., 1997) was found by Joenje et al. (2000) to be the same as FANCA. Joenje et al. (1995) presented evidence for a fifth subtype of Fanconi anemia, designated group E. Buchwald (1995) stated that 6 of 31 patients (12.7%) could be classified as group E. The FACE group is defined as being different from groups A (OMIM Ref. No. 227650), B (OMIM Ref. No. 227660), C (OMIM Ref. No. 227645), and D (OMIM Ref. No. 227646) and may itself be heterogeneous.

[7534] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7535] Joenje, H.; Lo Ten Foe, J. R.; Oostra, A. B.; van Berkel, C. G. M.; Rooimans, M. A.; Schroeder-Kurth, T.; Wegner, R.-D.; Gille, J. J. P.; Buchwald, M.; Arwert, F. : Classification of Fanconi anemia patients by complementation analysis: evidence for a fifth genetic subtype. Blood 86: 2156–2160,

1995. ; and

[7536] Buchwald, M. : Complementation groups: one or more per gene? Nature Genet. 11: 228–230, 1995.

[7537] Further studies establishing the function and utilities of FANCE are found in John Hopkins OMIM database record ID 600901, and in cited publications numbered 9588, 9367, 9368, 943 and 9605–9606 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801) is another VGAM57 host target gene. FKBP1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FKBP1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKBP1A BINDING SITE, designated SEQ ID:6472, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7538] Another function of VGAM57 is therefore inhibition of FK506 Binding Protein 1A, 12kDa (FKBP1A, Accession NM_000801), a gene which FK506-binding protein 1A. Accordingly, utilities of VGAM57 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with FKBP1A. The function of FKBP1A has been established by previous studies. FK506, a macrolide, is a powerful immunosuppressant like cyclosporin A (CsA). CsA and FK506 are chemically distinct but have remarkably similar immunosuppressive action, although FK506 is many times more potent than CsA. The action of CsA may be mediated through cyclophilin (OMIM Ref. No. 123840), which is identical to peptidyl–prolyl cis–trans isomerase (OMIM Ref. No. PPlase), and the immunosuppressive action of CsA in T cells may be mediated through inhibition of this enzyme activity. FK506–binding protein (FKBP) also has peptidyl–prolyl cis–trans isomerase enzymatic activity; however, whereas cyclophilin binds to, and is inhibited by, CsA but does not recognize FK506, the converse holds for FKBP. Since the 2 drugs have essentially equivalent action on T lymphocytes, it may be that they act through distinct pathways but their mode of action converges on PPlase activities. Maki et al. (1990) isolated and sequenced DNA coding for FKBP from human peripheral blood T lymphocytes by using mixed 20–mer oligonucleotide probes synthesized on the basis of the sequence of bovine FKBP. They found an open reading frame encoding 108 amino

acid residues, the first 40 of which were identical to those of the bovine sequence. Analysis showed no significant sequence similarity to any other known protein, including cyclophilin. Southern blot analysis of human genomic DNA digested with different restriction enzymes suggested the existence of only a few copies of the FKBP gene. This is in contrast to the results indicating as many as 20 copies of the cyclophilin gene as well as possible pseudogenes in the mammalian genome. Standaert et al. (1990) likewise isolated a cDNA for FKBP and reported the derived amino acid sequence. The human FKBP cDNA sequence showed significant similarity to an open reading frame in the genome of *Neisseria meningitidis*. Wang et al. (1994) reported that in a yeast genetic screen, FKBP1 interacted with various type I receptors, including the TGF- β type I receptor (OMIM Ref. No. 190181). Deletion, point mutation, and co-immunoprecipitation studies demonstrated the specificity of this interaction, and competitive binding assays indicated that the type I receptor may be a natural ligand for FKBP1. Wang et al. (1994) concluded that FKBP1 may play a role in type I receptor-mediated signaling. Peattie et al. (1994) identified 3 distinct mRNAs for FKBP12, designated A, B, and C, that result from differen-

tial splicing or polyadenylation. All 3 encode the same protein sequence. The ryanodine receptor on the sarcoplasmic reticulum is the major source of calcium required for cardiac muscle excitation–contraction coupling. The channel is a tetramer comprised of 4 RYR2 (OMIM Ref. No. 180902) polypeptides and 4 FK506–binding proteins (OMIM Ref. No. FKBP1A). Marx et al. (2000) showed that protein kinase A (PKA; OMIM Ref. No. 176911) phosphorylation of RYR2 dissociates FKBP1A and regulates the channel open probability. Using cosedimentation and coimmunoprecipitation, the authors defined a macromolecular complex comprised of RYR2, FKBP1A, PKA, the protein phosphatases PP1 (see OMIM Ref. No. 603771) and PP2A (see OMIM Ref. No. 603113), and an anchoring protein, AKAP6 (OMIM Ref. No. 604691). In failing human hearts, Marx et al. (2000) showed that RYR2 is PKA hyperphosphorylated, resulting in defective channel function due to increased sensitivity to calcium–induced activation. To define the functions of FKBP12 in vivo, Shou et al. (1998) generated mutant mice deficient in FKBP12 using embryonic stem (ES) cell technology. FKBP12–deficient mice had normal skeletal muscle but had severe dilated cardiomyopathy and ventricular septal defects that mim–

icked a human congenital heart disorder, namely non-compaction of left ventricular myocardium (see OMIM Ref. No. 300183 for an X-linked form of myocardial noncompaction). About 9% of the mutants exhibited exencephaly secondary to a defect in neural tube closure. Physiologic studies demonstrated that FKBP12 is dispensable for TGF-beta-mediated signaling, but modulates the calcium release activity of both skeletal and cardiac ryanodine receptors.

[7539] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7540] Standaert, R. F.; Galat, A.; Verdine, G. L.; Schreiber, S. L. : Molecular cloning and overexpression of the human FK506-binding protein FKBP. Nature 346: 671-674, 1990.
; and

[7542] Further studies establishing the function and utilities of FKBP1A are found in John Hopkins OMIM database record ID 186945, and in sited publications numbered

10032–1003 and 10271–10040 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069) is another VGAM57 host target gene. GNAI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI1 BINDING SITE, designated SEQ ID:7843, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7543] Another function of VGAM57 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069), a gene which is involved as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI1. The function of GNAI1 has been established by previous studies. The G proteins that mediate hormone responses can be divided into 2 broad cat-

egories according to their interaction with the bacterial toxins from *Vibrio cholera* and *Bordetella pertussis*. Those G proteins whose primary function is to stimulate adenylate kinase are substrates for ATP-ribosylation by cholera toxin, whereas those involved in hormonal inhibition of adenylate kinase and in regulation of other plasma membrane enzymes are substrates for pertussis toxin. The G protein family of signal transducers includes 5 heterotrimers, which are most clearly distinguished by their different alpha chains; they have virtually identical beta chains and similar gamma chains. The 5 heterotrimers are Gs (OMIM Ref. No. 139320) and Gi, the stimulatory and inhibitory GTP-binding regulators of adenylate cyclase; Go, a protein abundant in brain (see OMIM Ref. No. 139311); and transducin 1 (OMIM Ref. No. 139330) and transducin 2, proteins involved in phototransduction in retinal rods and cones, respectively. Sullivan et al. (1986) used a cDNA encoding bovine alpha chain of transducin 1 to isolate and sequence murine cDNAs for alpha(s) and alpha(i). Homologies and differences among the deduced amino acid sequences of the G protein and transducin alpha chains pointed to specific regions that may interact with guanine nucleotides, receptors, effector enzymes,

and the G protein beta-gamma complex. Studying cDNA clones, Bray et al. (1987) concluded that there are at least 2 classes of alpha(i) mRNA, one represented by brain tissue and another represented by monocytes. Suki et al. (1987) concluded that the human genome contains at least 3 nonallelic genes for alpha-i-type subunits of G protein. Neer et al. (1987) cloned and characterized cDNA encoding the predominant alpha(i) of brain, together with a very similar cDNA that encodes another putative G protein, alpha(h). The former gene was found to be located on human chromosome 7 by Southern blot analysis of DNA from mouse-human hybrid cell lines. Bloch et al. (1988) mapped the GNAI1 gene to 7q21 by in situ hybridization. They confirmed the regional location by studying human/mouse somatic cell hybrid lines containing portions of human chromosome 7. This location is near that of cystic fibrosis (CF; 219700), a disorder that is accompanied by hyporesponsiveness to beta-adrenergic medications. Bloch et al. (1988) excluded the GNAI1 locus as a 'candidate gene' for CF by showing that the GNAI1 gene is located closer to the centromere of chromosome 7 than are 2 marker loci that flank the CF locus. The relative position of these loci was determined by Southern analysis

of hybrid cells containing various portions of chromosome 7. By screening human genomic libraries with rat cDNAs for Gi-alpha as probes, Itoh et al. (1988) isolated 3 genes for the alpha subunit. The second and third are composed of 8 coding exons and 7 introns and possess completely identical exon-intron organization. Southern blot analysis indicated that a single copy of each of the 3 genes is present in the haploid human genome. Blatt et al. (1988) mapped GNAI1 to chromosome 7 by hybridization of cDNA clones with DNA from human-mouse somatic cell hybrids. By the study of restriction fragment length variation (RFLV) in an interspecific backcross between C57BL/6J and *Mus spretus* mice, Wilkie et al. (1992) demonstrated that the corresponding gene is located on mouse chromosome 5.

[7544] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7545] Bloch, D. B.; Bloch, K. D.; Iannuzzi, M.; Collins, F. S.; Neer, E. J.; Seidman, J. G.; Morton, C. C. : The gene for the alpha-i-1 subunit of human guanine nucleotide binding protein maps near the cystic fibrosis locus. *Am. J. Hum. Genet.* 42: 884-888, 1988. ; and

[7547] Further studies establishing the function and utilities of GNAI1 are found in John Hopkins OMIM database record ID 139310, and in cited publications numbered 4744-3603, 2187, 3604-360 and 2186 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM_022735) is another VGAM57 host target gene. GOCAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOCAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOCAP1 BINDING SITE, designated SEQ ID:22938, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7548] Another function of VGAM57 is therefore inhibition of Golgi Complex Associated Protein 1, 60kDa (GOCAP1, Accession NM_022735). Accordingly, utilities of VGAM57 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with GOCAP1. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935) is another VGAM57 host target gene. MLLT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT2 BINDING SITE, designated SEQ ID:12568, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7549] Another function of VGAM57 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 2 (MLLT2, Accession NM_005935), a gene which is a Putative transcription factor. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT2. The function of MLLT2 has been established by previous studies. Nakamura et al. (1993) found that the gene on chromosome 4q21 that is fused with the ALL1 gene in patients with acute lym-

phoblastic leukemia and translocation t(4;11)(q21;q23) and the gene on chromosome 9 that is fused with the ALL1 gene on chromosome 11 in patients with leukemia and the t(9;11)(p22;q23) show high sequence homology with the ENL gene on chromosome 19 which is fused to the ALL1 gene in patients with leukemia and the translocation t(11;19)(q23;p13). They found further that the protein products of the AF4, AF9 (MLLT3), and ENL (MLLT1) genes contained nuclear targeting sequences as well as serine-rich and proline-rich regions. Stretches abundant in basic amino acids were also present in the 3 proteins. These results indicated that the different proteins fused to ALL1 polypeptides in leukemia provide similar functional domains. Uckun et al. (1998) analyzed bone marrow leukemic cells of 17 infants and 127 children with newly diagnosed acute lymphatic leukemia (ALL), as well as fetal liver and bone marrow and normal infant bone marrow samples for the presence of a t(4;11) translocation, using standard cytogenetic techniques and expression of an MLL-AF4 fusion transcript by standard RT-PCR assays as well as nested RT-PCR that is 100-fold more sensitive than the standard RT-PCR. Overall, 9 of the 17 infants and 17 of 127 noninfant pediatric ALL patients were positive

for expression of MLL–AF4 fusion transcripts. None of the MLL–AF4(+) cases were positive for E2A–PBX1 (147141; 176310) or BCR–ABL (151410; 189980) fusion transcript expression. Although 8 of 9 MLL–AF4(+) infants had cytogenetically detectable t(4;11) translocation, 15 of the 17 MLL–AF4(+) noninfants were t(4;11) negative. Infants with MLL–AF4(+) ALL had poor outcomes, whereas noninfant fusion–gene–positive, translocation–negative patients has favorable outcomes similar to MLL–AF4(–) patients. Notably, MLL–AF4 transcripts also were detected by nested RT–PCR in 4 of 16 fetal bone marrows, 5 of 13 fetal livers, and 1 of 6 normal infant bone marrows, but not in any of the 44 remission bone marrow specimens from pediatric ALL patients. These results represented unprecedented evidence that MLL–AF4 fusion transcripts can be present in normal hematopoietic cells, indicating that their expression is insufficient for leukemic transformation of normal lymphocyte precursors.

[7550] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7551] Nakamura, T.; Alder, H.; Gu, Y.; Prasad, R.; Canaani, O.; Kamada, N.; Gale, R. P.; Lange, B.; Crist, W. M.; Nowell, P.

C.; Croce, C. M.; Canaani, E. : Genes on chromosomes 4, 9, and 19 involved in 11q23 abnormalities in acute leukemia share sequence homology and/or common motifs. Proc. Nat. Acad. Sci. 90: 4631–4635, 1993. ; and

[7552] Uckun, F. M.; Herman–Hatten, K.; Crotty, M.–L.; Sensel, M. G.; Sather, H. N.; Tuel–Ahlgren, L.; Sarquis, M. B.; Bostrom, B.; Nachman, J. B.; Steinherz, P. G.; Gaynon, P. S.; Heerema, N.

[7553] Further studies establishing the function and utilities of MLLT2 are found in John Hopkins OMIM database record ID 159557, and in cited publications numbered 3275–3276, 1843–184 and 3277 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Nidogen (enactin) (NID, Accession NM_002508) is another VGAM57 host target gene. NID BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NID BINDING SITE, designated SEQ ID:8340, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7554] Another function of VGAM57 is therefore inhibition of Nidogen (enactin) (NID, Accession NM_002508). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NID. 5'-nucleotidase, Ecto (CD73) (NT5E, Accession NM_002526) is another VGAM57 host target gene. NT5E BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NT5E, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5E BINDING SITE, designated SEQ ID:8364, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7555] Another function of VGAM57 is therefore inhibition of 5'-nucleotidase, Ecto (CD73) (NT5E, Accession NM_002526). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5E. SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily C, Member 1 (SMARCC1, Accession NM_003074) is another VGAM57 host target gene. SMARCC1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by SMARCC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMARCC1 BINDING SITE, designated SEQ ID:9041, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7556] Another function of VGAM57 is therefore inhibition of SWI/SNF Related, Matrix Associated, Actin Dependent Regulator of Chromatin, Subfamily C, Member 1 (SMARCC1, Accession NM_003074), a gene which is involved in chromatin remodeling. Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMARCC1. The function of SMARCC1 has been established by previous studies. Chromatin is actively remodeled during development. Chromatin remodeling of certain genes appears to precede their transcriptional activation. In yeast, the multisubunit SWI/SNF complex is thought to be responsible for chromatin remodeling. Wang et al. (1996) isolated an analogous SWI/SNF complex from human YT cells. They found that the resultant complexes are com-

posed of 9 to 12 polypeptides, which they termed BAFs (for BRG1-associated factors). Wang et al. (1996) isolated BAF155 from a human Jurkat T-cell cDNA library. This gene encodes a polypeptide of 1,104 amino acids, and is homologous both to the yeast SWI3 gene and to BAF170, another of the proteins in this chromatin remodeling complex (OMIM Ref. No. 601734). SWI3, BAF155, and BAF170 all contain a predicted leucine zipper region (a dimerization motif for a variety of transcription factors) and a myb-like tryptophan-repeat domain. Western blot analysis and EST database analysis revealed that BAF155 is expressed in many tissues

[7557] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7559] Wang, W.; Xue, Y.; Zhou, S.; Kuo, A.; Cairns, B. R.; Crabtree, G. R. : Diversity and specialization of mammalian SWI/SNF complexes. *Genes Dev.* 10: 2117-2130, 1996.

[7560] Further studies establishing the function and utilities of SMARCC1 are found in John Hopkins OMIM database record ID 601732, and in cited publications numbered 9322–9323 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169) is another VGAM57 host target gene. SUFU BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SUFU, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SUFU BINDING SITE, designated SEQ ID:18256, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7561] Another function of VGAM57 is therefore inhibition of Suppressor of Fused Homolog (Drosophila) (SUFU, Accession NM_016169). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SUFU. ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069) is another VGAM57 host target gene. ATP1B4 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by ATP1B4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP1B4 BINDING SITE, designated SEQ ID:14325, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7562] Another function of VGAM57 is therefore inhibition of ATPase, (Na⁺)/K⁺ Transporting, Beta 4 Polypeptide (ATP1B4, Accession NM_012069). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP1B4. COE2 (Accession XM_034639) is another VGAM57 host target gene. COE2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COE2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COE2 BINDING SITE, designated SEQ ID:32128, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7563] Another function of VGAM57 is therefore inhibition of

COE2 (Accession XM_034639). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COE2. DKFZP564O0423 (Accession XM_166254) is another VGAM57 host target gene. DKFZP564O0423 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564O0423, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0423 BINDING SITE, designated SEQ ID:44066, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7564] Another function of VGAM57 is therefore inhibition of DKFZP564O0423 (Accession XM_166254). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0423. FLJ10420 (Accession NM_018090) is another VGAM57 host target gene. FLJ10420 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of FLJ10420 BINDING SITE, designated SEQ ID:19856, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7565] Another function of VGAM57 is therefore inhibition of FLJ10420 (Accession NM_018090). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10420. FLJ11117 (Accession NM_018329) is another VGAM57 host target gene. FLJ11117 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11117 BINDING SITE, designated SEQ ID:20327, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7566] Another function of VGAM57 is therefore inhibition of FLJ11117 (Accession NM_018329). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11117. FLJ14457 (Accession NM_032788) is another VGAM57

host target gene. FLJ14457 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14457, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14457 BINDING SITE, designated SEQ ID:26542, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7567] Another function of VGAM57 is therefore inhibition of FLJ14457 (Accession NM_032788). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14457. FLJ23231 (Accession NM_025079) is another VGAM57 host target gene. FLJ23231 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23231, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23231 BINDING SITE, designated SEQ ID:24679, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7568] Another function of VGAM57 is therefore inhibition of FLJ23231 (Accession NM_025079). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23231. FLJ31978 (Accession NM_144669) is another VGAM57 host target gene. FLJ31978 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31978, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31978 BINDING SITE, designated SEQ ID:29490, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7569] Another function of VGAM57 is therefore inhibition of FLJ31978 (Accession NM_144669). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31978. FLJ32334 (Accession NM_144565) is another VGAM57 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29367, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7570] Another function of VGAM57 is therefore inhibition of FLJ32334 (Accession NM_144565). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. GBTS1 (Accession NM_145173) is another VGAM57 host target gene. GBTS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GBTS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GBTS1 BINDING SITE, designated SEQ ID:29729, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7571] Another function of VGAM57 is therefore inhibition of GBTS1 (Accession NM_145173). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GBTS1.

ITM3 (Accession NM_030926) is another VGAM57 host target gene. ITM3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ITM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITM3 BINDING SITE, designated SEQ ID:25195, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7572] Another function of VGAM57 is therefore inhibition of ITM3 (Accession NM_030926). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITM3. KIAA0350 (Accession XM_028332) is another VGAM57 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30671, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2768.

[7573] Another function of VGAM57 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. KIAA0663 (Accession NM_014827) is another VGAM57 host target gene. KIAA0663 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0663, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0663 BINDING SITE, designated SEQ ID:16811, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7574] Another function of VGAM57 is therefore inhibition of KIAA0663 (Accession NM_014827). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0663. KIAA0795 (Accession NM_025010) is another VGAM57 host target gene. KIAA0795 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0795, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0795 BINDING SITE, designated SEQ ID:24585, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7575] Another function of VGAM57 is therefore inhibition of KIAA0795 (Accession NM_025010). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0795. KIAA1010 (Accession XM_050742) is another VGAM57 host target gene. KIAA1010 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1010, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1010 BINDING SITE, designated SEQ ID:35668, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7576] Another function of VGAM57 is therefore inhibition of KIAA1010 (Accession XM_050742). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1010. KIAA1210 (Accession XM_172801) is another VGAM57 host target gene. KIAA1210 BINDING SITE1 and KIAA1210 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1210, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1210 BINDING SITE1 and KIAA1210 BINDING SITE2, designated SEQ ID:46085 and SEQ ID:46086 respectively, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7577] Another function of VGAM57 is therefore inhibition of KIAA1210 (Accession XM_172801). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1210. KIAA1775 (Accession NM_033100) is another VGAM57 host target gene. KIAA1775 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1775, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA1775 BINDING SITE, designated SEQ ID:26941, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7578] Another function of VGAM57 is therefore inhibition of KIAA1775 (Accession NM_033100). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1775. KIAA1829 (Accession XM_030378) is another VGAM57 host target gene. KIAA1829 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1829, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1829 BINDING SITE, designated SEQ ID:31029, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7579] Another function of VGAM57 is therefore inhibition of KIAA1829 (Accession XM_030378). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1829. Protocadherin 10 (PCDH10, Accession

NM_032961) is another VGAM57 host target gene.

PCDH10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PCDH10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDH10 BINDING SITE, designated SEQ ID:26769, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7580] Another function of VGAM57 is therefore inhibition of Protocadherin 10 (PCDH10, Accession NM_032961). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH10. TRIP-Br2 (Accession NM_014755) is another VGAM57 host target gene. TRIP-Br2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIP-Br2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIP-Br2 BINDING SITE, designated SEQ ID:16491, to the nucleotide sequence of VGAM57 RNA, herein designated

VGAM RNA, also designated SEQ ID:2768.

[7581] Another function of VGAM57 is therefore inhibition of TRIP-Br2 (Accession NM_014755). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIP-Br2. LOC115073 (Accession XM_055193) is another VGAM57 host target gene. LOC115073 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC115073, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC115073 BINDING SITE, designated SEQ ID:36236, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7582] Another function of VGAM57 is therefore inhibition of LOC115073 (Accession XM_055193). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC115073. LOC128344 (Accession XM_059234) is another VGAM57 host target gene. LOC128344 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128344, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128344 BINDING SITE, designated SEQ ID:36922, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7583] Another function of VGAM57 is therefore inhibition of LOC128344 (Accession XM_059234). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128344. LOC143452 (Accession XM_084522) is another VGAM57 host target gene. LOC143452 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143452 BINDING SITE, designated SEQ ID:37622, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7584] Another function of VGAM57 is therefore inhibition of LOC143452 (Accession XM_084522). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143452. LOC144308 (Accession XM_096575) is another VGAM57 host target gene. LOC144308 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC144308, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144308 BINDING SITE, designated SEQ ID:40407, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7585] Another function of VGAM57 is therefore inhibition of LOC144308 (Accession XM_096575). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144308. LOC152573 (Accession XM_087488) is another VGAM57 host target gene. LOC152573 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152573, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152573 BINDING SITE, designated SEQ ID:39288, to

the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7586] Another function of VGAM57 is therefore inhibition of LOC152573 (Accession XM_087488). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152573. LOC201194 (Accession XM_117061) is another VGAM57 host target gene. LOC201194 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201194, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201194 BINDING SITE, designated SEQ ID:43217, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7587] Another function of VGAM57 is therefore inhibition of LOC201194 (Accession XM_117061). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201194. LOC219899 (Accession XM_166173) is another VGAM57 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43993, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7588] Another function of VGAM57 is therefore inhibition of LOC219899 (Accession XM_166173). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219899. LOC253019 (Accession XM_170907) is another VGAM57 host target gene. LOC253019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253019 BINDING SITE, designated SEQ ID:45666, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7589] Another function of VGAM57 is therefore inhibition of LOC253019 (Accession XM_170907). Accordingly, utilities

of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253019. LOC253975 (Accession XM_171130) is another VGAM57 host target gene. LOC253975 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253975, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253975 BINDING SITE, designated SEQ ID:45933, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7590] Another function of VGAM57 is therefore inhibition of LOC253975 (Accession XM_171130). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253975. LOC257486 (Accession XM_045029) is another VGAM57 host target gene. LOC257486 BINDING SITE1 and LOC257486 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC257486, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of LOC257486 BINDING SITE1 and LOC257486 BINDING SITE2, designated SEQ ID:34323 and SEQ ID:34324 respectively, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7591] Another function of VGAM57 is therefore inhibition of LOC257486 (Accession XM_045029). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257486. LOC90170 (Accession XM_029589) is another VGAM57 host target gene. LOC90170 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90170 BINDING SITE, designated SEQ ID:30909, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7592] Another function of VGAM57 is therefore inhibition of LOC90170 (Accession XM_029589). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90170. LOC91208 (Accession XM_036935) is another VGAM57 host target gene. LOC91208 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91208 BINDING SITE, designated SEQ ID:32521, to the nucleotide sequence of VGAM57 RNA, herein designated VGAM RNA, also designated SEQ ID:2768.

[7593] Another function of VGAM57 is therefore inhibition of LOC91208 (Accession XM_036935). Accordingly, utilities of VGAM57 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91208. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 58 (VGAM58) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7594] VGAM58 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM58 was detected is described hereinabove with reference to Figs. 1–8.

[7595] VGAM58 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7596] VGAM58 gene encodes a VGAM58 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM58 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM58 precursor RNA is designated SEQ ID:44, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:44 is located at position 76117 relative to the genome of Invertebrate Iridescent Virus 6.

[7597] VGAM58 precursor RNA folds onto itself, forming VGAM58 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7598] An enzyme complex designated DICER COMPLEX, `dices` the VGAM58 folded precursor RNA into VGAM58 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM58 RNA is designated SEQ ID:2769, and is provided hereinbelow with reference to the sequence listing part.

[7599] VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM58 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7600] VGAM58 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM58 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM58 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM58 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7601] The complementary binding of VGAM58 RNA, herein designated VGAM RNA, to host target binding sites on VGAM58 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM58 host target RNA into VGAM58 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7602] It is appreciated that VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM58 host target genes. The mRNA of each one of this plurality of VGAM58 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM58 RNA, herein designated VGAM RNA, and which when bound by VGAM58 RNA causes inhibition of translation of respective one or more VGAM58 host target proteins.

[7603] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM58 gene, herein designated VGAM GENE, on one or more VGAM58 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7604] It is yet further appreciated that a function of VGAM58 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM58 correlate with, and may be deduced from, the identity of the host target genes which VGAM58 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7605] Nucleotide sequences of the VGAM58 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM58 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM58 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM58 are further described hereinbelow with reference to Table 1.

[7606] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM58 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM58 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7607] As mentioned hereinabove with reference to Fig. 1, a function of VGAM58 gene, herein designated VGAM is inhibition of expression of VGAM58 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM58 correlate with, and may be deduced from, the identity of the target genes which VGAM58 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7608] ETR101 (Accession XM_051364) is a VGAM58 host target gene. ETR101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ETR101, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of ETR101 BINDING SITE, designated SEQ ID:35829, to the nucleotide sequence of VGAM58 RNA, herein designated VGAM RNA, also designated SEQ ID:2769.

[7609] A function of VGAM58 is therefore inhibition of ETR101 (Accession XM_051364). Accordingly, utilities of VGAM58 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ETR101. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 59 (VGAM59) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7610] VGAM59 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM59 was detected is described hereinabove with reference to Figs. 1–8.

[7611] VGAM59 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7612] VGAM59 gene encodes a VGAM59 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM59 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM59 precursor RNA is designated SEQ ID:45, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:45 is located at position 64386 relative to the genome of Invertebrate Iridescent Virus 6.

[7613] VGAM59 precursor RNA folds onto itself, forming VGAM59 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7614] An enzyme complex designated DICER COMPLEX, `dices` the VGAM59 folded precursor RNA into VGAM59 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 64%) nucleotide sequence of VGAM59 RNA is designated SEQ ID:2770, and is provided hereinbelow with reference to the sequence listing part.

[7615] VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM59 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7616] VGAM59 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM59 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM59 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7617] The complementary binding of VGAM59 RNA, herein designated VGAM RNA, to host target binding sites on VGAM59 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM59 host target RNA into VGAM59 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7618] It is appreciated that VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM59 host target genes. The mRNA of each one of this plurality of VGAM59 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM59 RNA, herein designated VGAM RNA, and which when bound by VGAM59 RNA causes inhibition of translation of respective one or more VGAM59 host target proteins.

[7619] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM59 gene, herein designated VGAM GENE, on one or more VGAM59 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7620] It is yet further appreciated that a function of VGAM59 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM59 correlate with, and may be deduced from, the identity of the host target genes which VGAM59 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7621] Nucleotide sequences of the VGAM59 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM59 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM59 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM59 are further described hereinbelow with reference to Table 1.

[7622] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM59 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM59 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[7623] As mentioned hereinabove with reference to Fig. 1, a function of VGAM59 gene, herein designated VGAM is inhibition of expression of VGAM59 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM59 correlate with, and may be deduced from, the identity of the target genes which VGAM59 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7624] Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Accession NM_021951) is a VGAM59 host target gene. DMRT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DMRT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DMRT1 BINDING SITE, designated SEQ ID:22481, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:2770.

[7625] A function of VGAM59 is therefore inhibition of Doublesex and Mab-3 Related Transcription Factor 1 (DMRT1, Acces-

sion NM_021951), a gene which May be involved in male sexual development. Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DMRT1. The function of DMRT1 has been established by previous studies. Shan et al. (2000) reviewed the accumulating evidence that haploinsufficiency of a dosage-sensitive gene(s) in 9p24.3 is responsible for the failure of testicular development and feminization in XY patients with monosomy for 9p. They used molecular cytogenetic methods to characterize the sex-reversing 9p deletions in 2 XY females. FISH with YACs from the critical 9p region containing the DMRT1 gene proved to be a fast and reliable assay for patient screening. Comparative YAC mapping on great ape and Old and New World monkey chromosomes demonstrated that the critical region was moved from an interstitial position on the ancestral primate chromosome to a very subtelomeric position in chimpanzee and humans by a pericentric inversion(s). Pathologic 9p rearrangements may be the consequence of an evolutionary chromosome breakpoint in close proximity to the sex-reversal region. Muroya et al. (2000) reported clinical and molecular findings in 5 karyotypic males (cases 1–5) and 1 karyotypic

female (OMIM Ref. No. case 6) with distal 9p monosomy. Cases 1–3 and 6 had female external genitalia, case 4 showed ambiguous external genitalia, and case 5 exhibited male external genitalia with left cryptorchidism and right intrascrotal testis. Gonadal explorations at gonadectomy in case 3 and 4 revealed that case 3 had left streak gonad and right agonadism, and case 4 had bilateral hypoplastic testes. Endocrine studies in cases 1–4 and 6 showed that cases 1, 3, and 6 had definite primary hypogonadism, with basal FSH (see OMIM Ref. No. 118850) levels of 54, 39, and 41 IU/L, respectively, whereas case 2 with severe malnutrition was unremarkable for the baseline values, and case 4 had fairly good testicular function. FISH and microsatellite analyses demonstrated that all cases had hemizygosity of the 9p sex-determining region distal to D9S1779, with loss of DMRT1 and DMRT2 from the abnormal chromosome 9. Sequence analysis in cases 1–4 and 6 showed that they had normal sequences of each exon of DMRT1 and the DM domain of DMRT2 on the normal chromosome 9, and that cases 1–4 had normal SRY sequences. The authors concluded that the results provide further support for the presence of a sex-determining gene(s) on distal 9p and favor the possibility

of DMRT1 and/or DMRT2 being the sex-determining gene(s). They inferred that haploinsufficiency of the 9p sex-determining gene(s) primarily hinders the formation of indifferent gonad, leading to various degrees of defective testis formation in karyotypic males and impaired ovary function in karyotypic females.

[7626] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7627] Muroya, K.; Okuyama, T.; Goishi, K.; Ogiso, Y.; Fukuda, S.; Kameyama, J.; Sato, H.; Suzuki, Y.; Terasaki, H.; Gomyo, H.; Wakui, K.; Fukushima, Y.; Ogata, T. : Sex-determining gene(s) on distal 9p: clinical and molecular studies in six cases. J. Clin. Endocr. Metab. 85: 3094–3100, 2000. ; and

[7629] Further studies establishing the function and utilities of DMRT1 are found in John Hopkins OMIM database record ID 602424, and in cited publications numbered 122 and 8908–8914 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Calpain 6

(CAPN6, Accession NM_014289) is another VGAM59 host target gene. CAPN6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CAPN6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CAPN6 BINDING SITE, designated SEQ ID:15567, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:2770.

[7630] Another function of VGAM59 is therefore inhibition of Calpain 6 (CAPN6, Accession NM_014289). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CAPN6. FLJ13769 (Accession NM_025012) is another VGAM59 host target gene. FLJ13769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13769 BINDING SITE, designated SEQ ID:24592, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA,

also designated SEQ ID:2770.

[7631] Another function of VGAM59 is therefore inhibition of FLJ13769 (Accession NM_025012). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13769. FLJ22167 (Accession NM_024533) is another VGAM59 host target gene. FLJ22167 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ22167, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22167 BINDING SITE, designated SEQ ID:23740, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:2770.

[7632] Another function of VGAM59 is therefore inhibition of FLJ22167 (Accession NM_024533). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22167. H-plk (Accession NM_015852) is another VGAM59 host target gene. H-plk BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:17983, to the nucleotide sequence of VGAM59 RNA, herein designated VGAM RNA, also designated SEQ ID:2770.

[7633] Another function of VGAM59 is therefore inhibition of H-plk (Accession NM_015852). Accordingly, utilities of VGAM59 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 60 (VGAM60) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7634] VGAM60 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM60 was detected is described hereinabove with reference to Figs. 1–8.

[7635] VGAM60 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM60 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7636] VGAM60 gene encodes a VGAM60 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM60 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM60 precursor RNA is designated SEQ ID:46, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:46 is located at position 157538 relative to the genome of Invertebrate Iridescent Virus 6.

[7637] VGAM60 precursor RNA folds onto itself, forming VGAM60 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7638] An enzyme complex designated DICER COMPLEX, `dices` the VGAM60 folded precursor RNA into VGAM60 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM60 RNA is designated SEQ ID:2771, and is provided hereinbelow with reference to the sequence listing part.

[7639] VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM60 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7640] VGAM60 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM60 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM60 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7641] The complementary binding of VGAM60 RNA, herein designated VGAM RNA, to host target binding sites on VGAM60 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM60 host target RNA into VGAM60 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7642] It is appreciated that VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM60 host target genes. The mRNA of each one of this plurality of VGAM60 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM60 RNA, herein designated VGAM RNA, and which when bound by VGAM60 RNA causes inhibition of translation of respective one or more VGAM60 host target proteins.

[7643] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM60 gene, herein designated VGAM GENE, on one or more VGAM60 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7644] It is yet further appreciated that a function of VGAM60 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM60 correlate with, and may be deduced from, the identity of the host target genes which VGAM60 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7645] Nucleotide sequences of the VGAM60 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM60 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM60 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM60 are further described hereinbelow with reference to Table 1.

[7646] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM60 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM60 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7647] As mentioned hereinabove with reference to Fig. 1, a function of VGAM60 gene, herein designated VGAM is inhibition of expression of VGAM60 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM60 correlate with, and may be deduced from, the identity of the target genes which VGAM60 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7648] Cadherin 6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932) is a VGAM60 host target gene. CDH6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDH6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDH6 BINDING SITE, designated SEQ ID:11373, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7649] A function of VGAM60 is therefore inhibition of Cadherin

6, Type 2, K-cadherin (fetal kidney) (CDH6, Accession NM_004932), a gene which is a calcium dependent cell adhesion protein. Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDH6. The function of CDH6 has been established by previous studies. Cadherins are calcium-dependent cell-cell adhesion molecules that mediate cell-cell binding in a homophilic manner. They play key roles in morphogenesis and in the maintenance of orderly structures such as epithelium, and may be involved in the metastasis and invasion of cancer. Mature cadherin proteins are composed of a large N-terminal extracellular domain, a single membrane-spanning domain, and a small C-terminal cytoplasmic domain. The extracellular domain consists of 5 subdomains, each containing a cadherin motif, and appears to determine the specificity of the homophilic cell adhesion activity of the cadherin; the amino acid sequence of the cytoplasmic domain is highly conserved among cadherins. CLONING By PCR using degenerate oligonucleotides based on highly conserved sequences of the cadherin cytoplasmic domain, followed by screening of a human fetal brain cDNA library, Suzuki et al. (1991) isolated a partial cDNA encoding

CDH6. Using this partial CDH6 cDNA to screen a human hepatocellular carcinoma cell cDNA library, Shimoyama et al. (1995) cloned a full-length CDH6 cDNA. The deduced 790-amino acid CDH6 protein contains a signal sequence, prosequence, extracellular domain, transmembrane sequence, and cytoplasmic domain. The predicted 737-amino acid mature CDH6 protein has 97% amino acid similarity with rat K-cadherin, 64% with human CDH12 (OMIM Ref. No. 600562), and 60% with human CDH8 (OMIM Ref. No. 603008) and CDH11 (OMIM Ref. No. 600023). Northern blot analysis detected multiple CDH6 transcripts in a variety of normal human tissues, with highest levels in kidney, brain, and cerebellum; no expression was found in liver, heart, or colonic mucosa. Four of 6 hepatocellular carcinoma cell lines and 3 of 4 renal carcinoma cell lines showed strong expression of CDH6 transcripts. Among small cell lung carcinoma lines, all 11 CDH6-positive lines were of the classic type, whereas all 4 CDH6-negative lines were of the variant type.

[7650] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7651] Shimoyama, Y.; Gotoh, M.; Terasaki, T.; Kitajima, M.; Hiro-

hashi, S. : Isolation and sequence analysis of human cadherin-6 complementary DNA for the full coding sequence and its expression in human carcinoma cells. Cancer Res. 55: 2206-2211, 1995. ; and

[7652] Suzuki, S.; Sano, K.; Tanihara, H. : Diversity of the cadherin family: evidence for eight new cadherins in nervous tissue. Cell Regul. 2: 261-270, 1991.

[7653] Further studies establishing the function and utilities of CDH6 are found in John Hopkins OMIM database record ID 603007, and in cited publications numbered 587 and 5878 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pro-melanin-concentrating Hormone-like 1 (PMCHL1, Accession NM_031887) is another VGAM60 host target gene. PMCHL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMCHL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMCHL1 BINDING SITE, designated SEQ ID:25632, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7654] Another function of VGAM60 is therefore inhibition of Pro-melanin-concentrating Hormone-like 1 (PMCHL1, Accession NM_031887). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMCHL1. Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155) is another VGAM60 host target gene. SERPINB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SERPINB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SERPINB9 BINDING SITE, designated SEQ ID:10368, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7655] Another function of VGAM60 is therefore inhibition of Serine (or cysteine) Proteinase Inhibitor, Clade B (ovalbumin), Member 9 (SERPINB9, Accession NM_004155), a gene which may be a serpin serine protease inhibitor that interacts with granzyme B (GZMB). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with SERPINB9. The function of SERPINB9 has been established by previous studies. Serine proteinase inhibitors (serpins) are a large superfamily of proteins which bind to and inactivate serine proteinases. These interactions are involved in many cellular processes including coagulation, fibrinolysis, complement fixation, matrix remodeling, and apoptosis. Sprecher et al. (1995) isolated PI8 (OMIM Ref. No. 601697) and PI9 cDNAs from a human placenta cDNA library. The authors found that PI9 encodes a 374-amino acid polypeptide with over 60% identity with PI6. Northern blot analysis by Sprecher et al. (1995) demonstrated that PI9 is expressed as 2 transcripts of 3.4 and 4.4 kb which were detected in greatest abundance in lung and placenta. In searching for serpins related to PI6, Sun et al. (1996) isolated and cloned PI9 from human bone marrow mRNA using a PCR cloning strategy. They confirmed that the sequence of PI9 is closely related to PI6 (OMIM Ref. No. 173321) and the viral serpin CrmA. Sun et al. (1996) showed that PI9 forms an SDS-resistant complex with granzyme B (OMIM Ref. No. 123910), suggesting that these 2 proteins may form a physiologically significant serpin-serine proteinase interaction. Sun et al. (1996) also observed that PI9 was expressed in immune tissue,

including lymphocytes, natural killer cell leukemia cell lines, and peripheral blood mononuclear cells. Sun et al. (1996) used fractionation experiments to show that PI9 is localized to the cytosol, in a separate subcellular compartment from granzyme B. PI9 was identified as an endogenous inhibitor of caspase-1 (OMIM Ref. No. 147678). Krieg et al. (2001) reported that PI9 mRNA and protein are rapidly and directly induced by estrogen in human liver cells. Using transient transfections to assay PI9 promoter truncations and mutations, they showed that this strong estrogen induction is mediated by a unique downstream estrogen responsive unit (ERU) approximately 200 nucleotides downstream of the transcription start site. They also demonstrated estrogen-dependent binding of ER to the cellular PI9 promoter. The ERU consists of an imperfect estrogen response element (ERE) palindrome immediately adjacent to a direct repeat containing two consensus ERE half-sites separated by 13 nucleotides (DR13). In transient transfections, all 4 of the ERE half-sites in the imperfect ERE and in the DR13 were important for estrogen inducibility. They concluded that a direct repeat can function with an imperfect ERE palindrome to confer estrogen inducibility on a native gene, which extends the

repertoire of DNA sequences able to function as EREs.

[7656] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7657] Sun, J.; Bird, C. H.; Sutton, V.; McDonald, L.; Coughlin, P. B.; De Jong, T. A.; Trapani, J. A.; Bird, P. I. : A cytosolic granzyme B inhibitor related to the viral apoptotic regulator cytokine response modifier A is present in cytotoxic lymphocytes. J. Biol. Chem. 271: 27802–27809, 1996. ; and

[7658] Krieg, S. A.; Krieg, A. J.; Shapiro, D. J. : A unique downstream estrogen responsive unit mediates estrogen induction of proteinase inhibitor–9, a cellular inhibitor of IL–1–beta–conver.

[7659] Further studies establishing the function and utilities of SERPINB9 are found in John Hopkins OMIM database record ID 601799, and in cited publications numbered 6248–625 and 6708 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187) is another VGAM60 host target gene. SMCX BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SMCX,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMCX BINDING SITE, designated SEQ ID:10397, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7660] Another function of VGAM60 is therefore inhibition of Smcx Homolog, X Chromosome (mouse) (SMCX, Accession NM_004187), a gene which escapes X inactivation. Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMCX. The function of SMCX has been established by previous studies. Agulnik et al. (1994) cloned a gene, designated Smcx, from the mouse X chromosome by its homology to the Y-located gene Smcy. Using direct in situ hybridization, Smcx was mapped to the distal end of the mouse X chromosome (XF2–XF4) and its human homolog, SMCX, was mapped to proximal Xp (Xp11.2–p11.1). Meiotic mapping in the mouse placed Smcx in the interval between Plp and Pdha1. Agulnik et al. (1994) showed that the Smcx gene escapes X inactivation; in hamster/human hybrids, it was expressed when either an active or an inactive human X chromosome was

present. Furthermore, 2 alleles of Smcx were found to be expressed in t(16;X)16H female mice despite the intact X chromosome being inactive in all cells. Thus, Smcx is also not subject to X inactivation. Agulnik et al. (1994) stated that this was the first example in the mouse of a gene that escapes X inactivation. Brown et al. (1995) demonstrated that the DXS423E gene (OMIM Ref. No. 300040), which is also located on Xp11.22–p11.21, likewise escapes X chromosome inactivation. Thus, the DXS423E and XE169 genes define a new region in the proximal short arm of the X chromosome that is not subject to X chromosome inactivation. Lingenfelter et al. (1998) showed that Smcx is susceptible to complete X inactivation in a portion of mouse embryonic cells. Furthermore, Smcx inactivation persists in some cells at least until 13.5 days postcoitum. A highly variable Smcx expression found during mouse development progressively disappears in adult tissues where nearly equal expression between alleles is observed

[7661] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7662] Agulnik, A. I.; Mitchell, M. J.; Mattei, M.–G.; Borsani, G.; Avner, P. A.; Lerner, J. L.; Bishop, C. E. : A novel X gene

with a widely transcribed Y-linked homologue escapes X-inactivation in mouse and human. Hum. Molec. Genet. 3: 879-884, 1994. ; and

[7663] Lingenfelter, P. A.; Adler, D. A.; Poslinski, D.; Thomas, S.; Elliott, R. W.; Chapman, V. M.; Disteche, C. M. : Escape from X inactivation of Smcx is preceded by silencing during mouse deve.

[7664] Further studies establishing the function and utilities of SMCX are found in John Hopkins OMIM database record ID 314690, and in cited publications numbered 2925-292 and 7316-2929 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788) is another VGAM60 host target gene. UBE4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBE4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBE4A BINDING SITE, designated SEQ ID:11193, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7665] Another function of VGAM60 is therefore inhibition of Ubiquitination Factor E4A (UFD2 homolog, yeast) (UBE4A, Accession NM_004788), a gene which binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBE4A. The function of UBE4A has been established by previous studies. Ubiquitination involves a ubiquitin-activating enzyme, or E1 (see OMIM Ref. No. UBE1, 314370), a ubiquitin-conjugating enzyme, or E2 (see OMIM Ref. No. UBE2D1, 602961), and often a substrate-specific ubiquitin-protein ligase, or E3 (see OMIM Ref. No. UBE3A, 601623). Koegl et al. (1999) showed that efficient multiubiquitination necessary for proteasomal targeting of a model substrate requires an additional conjugation factor, which they referred to as E4. This protein, previously known as UFD2 in yeast, binds to the ubiquitin moieties of preformed conjugates and catalyzes ubiquitin chain assembly in conjunction with E1, E2, and E3. Protein E4 defines a novel protein family that includes the human protein KIAA0126 (first described by Nagase et al. (1995)) and the regulatory protein NOSA from Dictyostelium. Hu-

man protein KIAA0126 contains 1,073 predicted amino acid residues. In yeast, E4 activity is linked to cell survival under stress conditions, indicating that eukaryotes utilize E4-dependent proteolysis pathways for multiple cellular functions. By analysis of a human/rodent hybrid cell panel, Nagase et al. (1995) mapped the gene encoding protein KIAA0126 to chromosome 11.

[7666] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7667] Koegl, M.; Hoppe, T.; Schlenker, S.; Ulrich, H. D.; Mayer, T. U.; Jentsch, S. : A novel ubiquitination factor, E4, is involved in multiubiquitin chain assembly. Cell 96: 635-644, 1999. ; and

[7668] Nagase, T.; Seki, N.; Tanaka, A.; Ishikawa, K.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. IV. The coding sequences of 40 new genes (KIAA0121-KIAA0160.

[7669] Further studies establishing the function and utilities of UBE4A are found in John Hopkins OMIM database record ID 603753, and in cited publications numbered 759 and 10969 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Fin-

ger Protein 141 (clone pHZ-44) (ZNF141, Accession NM_003441) is another VGAM60 host target gene. ZNF141 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZNF141, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF141 BINDING SITE, designated SEQ ID:9497, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7670] Another function of VGAM60 is therefore inhibition of Zinc Finger Protein 141 (clone pHZ-44) (ZNF141, Accession NM_003441). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF141. ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM_080283) is another VGAM60 host target gene. ABCA9 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ABCA9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of ABCA9 BINDING SITE, designated SEQ ID:27828, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7671] Another function of VGAM60 is therefore inhibition of ATP-binding Cassette, Sub-family A (ABC1), Member 9 (ABCA9, Accession NM_080283). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ABCA9. KIAA0534 (Accession XM_049349) is another VGAM60 host target gene. KIAA0534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0534 BINDING SITE, designated SEQ ID:35382, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7672] Another function of VGAM60 is therefore inhibition of KIAA0534 (Accession XM_049349). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0534. KIAA1229 (Accession XM_030665) is another

VGAM60 host target gene. KIAA1229 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1229, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1229 BINDING SITE, designated SEQ ID:31102, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7673] Another function of VGAM60 is therefore inhibition of KIAA1229 (Accession XM_030665). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1229. LOC129831 (Accession XM_059376) is another VGAM60 host target gene. LOC129831 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC129831, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129831 BINDING SITE, designated SEQ ID:36982, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7674] Another function of VGAM60 is therefore inhibition of LOC129831 (Accession XM_059376). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129831. LOC151040 (Accession XM_087082) is another VGAM60 host target gene. LOC151040 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151040 BINDING SITE, designated SEQ ID:39045, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7675] Another function of VGAM60 is therefore inhibition of LOC151040 (Accession XM_087082). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151040. LOC254672 (Accession XM_170619) is another VGAM60 host target gene. LOC254672 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254672, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254672 BINDING SITE, designated SEQ ID:45399, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7676] Another function of VGAM60 is therefore inhibition of LOC254672 (Accession XM_170619). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254672. LOC90843 (Accession XM_034430) is another VGAM60 host target gene. LOC90843 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90843, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90843 BINDING SITE, designated SEQ ID:32116, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7677] Another function of VGAM60 is therefore inhibition of LOC90843 (Accession XM_034430). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC90843. LOC92568 (Accession XM_045852) is another VGAM60 host target gene. LOC92568 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92568, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92568 BINDING SITE, designated SEQ ID:34582, to the nucleotide sequence of VGAM60 RNA, herein designated VGAM RNA, also designated SEQ ID:2771.

[7678] Another function of VGAM60 is therefore inhibition of LOC92568 (Accession XM_045852). Accordingly, utilities of VGAM60 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92568. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 61 (VGAM61) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7679] VGAM61 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM61 was detected is described hereinabove with reference to Figs. 1–8.

[7680] VGAM61 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7681] VGAM61 gene encodes a VGAM61 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM61 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM61 precursor RNA is designated SEQ ID:47, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:47 is located at position 133573 relative to the genome of Invertebrate Iridescent Virus 6.

[7682] VGAM61 precursor RNA folds onto itself, forming VGAM61 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7683] An enzyme complex designated DICER COMPLEX, `dices` the VGAM61 folded precursor RNA into VGAM61 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM61 RNA is designated SEQ ID:2772, and is provided hereinbelow with reference to the sequence listing part.

[7684] VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM61 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7685] VGAM61 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM61 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM61 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM61 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7686] The complementary binding of VGAM61 RNA, herein designated VGAM RNA, to host target binding sites on VGAM61 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM61 host target RNA into VGAM61 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7687] It is appreciated that VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM61 host target genes. The mRNA of each one of this plurality of VGAM61 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM61 RNA, herein designated VGAM RNA, and which when bound by VGAM61 RNA causes inhibition of translation of respective one or more VGAM61 host target proteins.

[7688] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM61 gene, herein designated VGAM GENE, on one or more VGAM61 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7689] It is yet further appreciated that a function of VGAM61 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM61 correlate with, and may be deduced from, the identity of the host target genes which VGAM61 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7690] Nucleotide sequences of the VGAM61 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM61 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM61 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM61 are further described hereinbelow with reference to Table 1.

[7691] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM61 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM61 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7692] As mentioned hereinabove with reference to Fig. 1, a function of VGAM61 gene, herein designated VGAM is inhibition of expression of VGAM61 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM61 correlate with, and may be deduced from, the identity of the target genes which VGAM61 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7693] F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM_033535) is a VGAM61 host target gene. FBXL5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FBXL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of FBXL5 BINDING SITE, designated SEQ ID:27305, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7694] A function of VGAM61 is therefore inhibition of F-box and Leucine-rich Repeat Protein 5 (FBXL5, Accession NM_033535), a gene which is a putative SCF ubiquitin ligase subunit involved in protein degradation. Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FBXL5. The function of FBXL5 has been established by previous studies. The F box, named after cyclin F (CCNF; 600227), in which it was originally observed, is an approximately 40-amino acid motif that binds SKP1 (OMIM Ref. No. 601434). F-box proteins are components of modular E3 ubiquitin protein ligases called SCFs (SKP1, OMIM Ref. No. 603134, F-box proteins), which function in phosphorylation-dependent ubiquitination. Using a yeast 2-hybrid screen with SKP1 as bait, followed by searching sequence databases, Winston et al. (1999) and Cenciarelli et al. (1999) identified 33 mammalian and 26 human F-box proteins, respectively. These contained C termini with leucine-rich repeats (FBXLs, e.g., SKP2 (OMIM

Ref. No. 601436)), WD40 domains (FBXWs, e.g., BTRCP (OMIM Ref. No. 603482)), or no recognizable motifs (FBXOs, e.g., CCNF). Winston et al. (1999) predicted the presence of 6 leucine-rich repeats (LRRs) in FBXL5. RT-PCR analysis detected expression in all tissues tested, with highest levels in heart and pancreas.

[7695] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7696] Ilyin, G. P.; Rialland, M.; Pigeon, C.; Guguen-Guillouzo, C. : cDNA cloning and expression analysis of new members of the mammalian F-box protein family. *Genomics* 67: 40-47, 2000. ; and

[7697] Winston, J. T.; Koepp, D. M.; Zhu, C.; Elledge, S. J.; Harper, J. W. : A family of mammalian F-box proteins. *Curr. Biol.* 9: 1180-1182, 1999.

[7698] Further studies establishing the function and utilities of FBXL5 are found in John Hopkins OMIM database record ID 605655, and in cited publications numbered 40 and 8278 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069) is another

VGAM61 host target gene. GNAI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNAI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNAI1 BINDING SITE, designated SEQ ID:7841, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7699] Another function of VGAM61 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Alpha Inhibiting Activity Polypeptide 1 (GNAI1, Accession NM_002069), a gene which is involved as modulators or transducers in various transmembrane signaling systems. Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNAI1. The function of GNAI1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM57. General Transcription Factor IIF, Polypeptide 1, 74kDa (GTF2F1, Accession NM_002096) is another VGAM61 host target gene. GTF2F1 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by GTF2F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2F1 BINDING SITE, designated SEQ ID:7885, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7700] Another function of VGAM61 is therefore inhibition of General Transcription Factor IIF, Polypeptide 1, 74kDa (GTF2F1, Accession NM_002096), a gene which helps to recruit it to the initiation complex in collaboration with tfiib. it promotes transcription elongation. Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2F1. The function of GTF2F1 has been established by previous studies. At least 6 chromatographically resolvable general transcription factors may participate in accurate initiation by RNA polymerase II in HeLa cell-derived systems. TFIIF can bind directly to RNA polymerase II in solution and decrease the affinity of RNA polymerase II for nonspecific DNA. TFIIF is known to act at an intermediate stage in initiation complex formation. It

acts after TFIID (OMIM Ref. No. 313650) firmly associates with DNA, but coincidentally with or immediately after RNA polymerase II binding to DNA, and before the recruitment of factor TFIIIE (189962, 189964). The small subunit (RAP30; 189969) of TFIIF was cloned by Sopta et al. (1989) and shown to have some amino acid sequence homology to bacterial sigma factors. Aso et al. (1992) partially sequenced the RAP74 protein from purified HeLa cells, cloned its cDNA, and showed that its translation product can interact with RAP30 in vitro as well as in vivo. The cDNA predicted an amino acid sequence that lacks obvious DNA or RNA helicase motifs. Finkelstein et al. (1992) likewise isolated a cDNA encoding RAP74 and showed that both RAP30 and RAP74 produced in *Escherichia coli* could be used in place of natural human RAP30/74 to direct accurate transcription initiation by RNA polymerase II in vitro.

[7701] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7702] Sopta, M.; Burton, Z. F.; Greenblatt, J. : Structure and associated DNA-helicase activity of a general transcription initiation factor that binds to RNA polymerase II. *Nature*

341: 410–414, 1989. ; and

[7703] Finkelstein, A.; Kostrub, C. F.; Li, J.; Chavez, D. P.; Wang, B. Q.; Fang, S. M.; Greenblatt, J.; Burton, Z. F. : A cDNA encoding RAP74, a general initiation factor for transcription by.

[7704] Further studies establishing the function and utilities of GTF2F1 are found in John Hopkins OMIM database record ID 189968, and in cited publications numbered 9701–9705 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0527 (Accession XM_171054) is another VGAM61 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45851, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7705] Another function of VGAM61 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0527. Synaptophysin-like Protein (SYPL, Accession XM_167511) is another VGAM61 host target gene. SYPL BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYPL BINDING SITE, designated SEQ ID:44644, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7706] Another function of VGAM61 is therefore inhibition of Synaptophysin-like Protein (SYPL, Accession XM_167511). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYPL. LOC145820 (Accession XM_085246) is another VGAM61 host target gene. LOC145820 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145820, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145820 BINDING SITE, designated SEQ ID:37989, to

the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7707] Another function of VGAM61 is therefore inhibition of LOC145820 (Accession XM_085246). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145820. LOC201627 (Accession XM_114353) is another VGAM61 host target gene. LOC201627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201627 BINDING SITE, designated SEQ ID:42898, to the nucleotide sequence of VGAM61 RNA, herein designated VGAM RNA, also designated SEQ ID:2772.

[7708] Another function of VGAM61 is therefore inhibition of LOC201627 (Accession XM_114353). Accordingly, utilities of VGAM61 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201627. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Ad-

dress Messenger 62 (VGAM62) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7709] VGAM62 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM62 was detected is described hereinabove with reference to Figs. 1–8.

[7710] VGAM62 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7711] VGAM62 gene encodes a VGAM62 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM62 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM62 precursor RNA is designated SEQ ID:48, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:48 is located at position 134360 relative to the genome of Invertebrate Iridescent Virus 6.

[7712] VGAM62 precursor RNA folds onto itself, forming VGAM62 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7713] An enzyme complex designated DICER COMPLEX, `dices` the VGAM62 folded precursor RNA into VGAM62 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 62%) nucleotide sequence of VGAM62 RNA is designated SEQ ID:2773, and is provided hereinbelow with reference to the sequence listing part.

[7714] VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM62 host target RNA, herein designated VGAM HOST

TARGET RNA. VGAM62 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7715] VGAM62 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM62 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM62 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region,

this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7716] The complementary binding of VGAM62 RNA, herein designated VGAM RNA, to host target binding sites on VGAM62 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM62 host target RNA into VGAM62 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7717] It is appreciated that VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM62 host target genes. The mRNA of each one of this plurality of VGAM62 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM62 RNA, herein designated VGAM RNA, and which when bound by VGAM62 RNA causes inhibition of translation of respective one or more VGAM62 host target proteins.

[7718] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM62 gene, herein designated VGAM GENE, on one or more VGAM62 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7719] It is yet further appreciated that a function of VGAM62 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM62 correlate with, and may be deduced from, the identity of the host target genes which VGAM62 binds and inhibits, and the function of these host target genes, as elaborated

hereinbelow.

[7720] Nucleotide sequences of the VGAM62 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM62 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM62 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM62 are further described hereinbelow with reference to Table 1.

[7721] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM62 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM62 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7722] As mentioned hereinabove with reference to Fig. 1, a function of VGAM62 gene, herein designated VGAM is inhibition of expression of VGAM62 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM62 correlate with, and may be deduced from, the identity of the target genes which VGAM62 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7723] Eyes Absent Homolog 1 (Drosophila) (EYA1, Accession NM_000503) is a VGAM62 host target gene. EYA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EYA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EYA1 BINDING SITE, designated SEQ ID:6117, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7724] A function of VGAM62 is therefore inhibition of Eyes Absent Homolog 1 (Drosophila) (EYA1, Accession NM_000503). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EYA1. Leucine-zipper-like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767) is another VGAM62 host target gene. LZTR1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LZTR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LZTR1 BINDING SITE, designated SEQ ID:13633, to the

nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7725] Another function of VGAM62 is therefore inhibition of Leucine–zipper–like Transcriptional Regulator, 1 (LZTR1, Accession NM_006767). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LZTR1. ERAP140 (Accession XM_059748) is another VGAM62 host target gene. ERAP140 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ERAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERAP140 BINDING SITE, designated SEQ ID:37089, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7726] Another function of VGAM62 is therefore inhibition of ERAP140 (Accession XM_059748). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERAP140. KIAA1557 (Accession XM_028289) is another VGAM62 host target gene. KIAA1557 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by KIAA1557, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1557 BINDING SITE, designated SEQ ID:30639, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7727] Another function of VGAM62 is therefore inhibition of KIAA1557 (Accession XM_028289). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1557. PR Domain Containing 10 (PRDM10, Accession NM_020228) is another VGAM62 host target gene. PRDM10 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRDM10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRDM10 BINDING SITE, designated SEQ ID:21499, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7728] Another function of VGAM62 is therefore inhibition of PR Domain Containing 10 (PRDM10, Accession NM_020228). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRDM10. Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM62 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9097, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7729] Another function of VGAM62 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. LOC148709 (Accession XM_086281) is another VGAM62 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38580, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7730] Another function of VGAM62 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC164295 (Accession XM_092767) is another VGAM62 host target gene. LOC164295 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC164295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164295 BINDING SITE, designated SEQ ID:40143, to the nucleotide sequence of VGAM62 RNA, herein designated VGAM RNA, also designated SEQ ID:2773.

[7731] Another function of VGAM62 is therefore inhibition of LOC164295 (Accession XM_092767). Accordingly, utilities

of VGAM62 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164295. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 63 (VGAM63) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7732] VGAM63 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM63 was detected is described hereinabove with reference to Figs. 1–8.

[7733] VGAM63 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7734] VGAM63 gene encodes a VGAM63 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM63 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM63 precursor RNA is designated SEQ ID:49, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:49 is located at position 98449 relative to the genome of Invertebrate Iridescent Virus 6.

[7735] VGAM63 precursor RNA folds onto itself, forming VGAM63 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7736] An enzyme complex designated DICER COMPLEX, `dices` the VGAM63 folded precursor RNA into VGAM63 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM63 RNA is designated SEQ ID:2774, and is

provided hereinbelow with reference to the sequence listing part.

[7737] VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM63 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7738] VGAM63 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM63 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM63 RNA,

herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7739] The complementary binding of VGAM63 RNA, herein designated VGAM RNA, to host target binding sites on VGAM63 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM63 host target RNA into VGAM63 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7740] It is appreciated that VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM63 host target genes. The mRNA of each one of this plurality of VGAM63 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM63 RNA, herein designated VGAM

RNA, and which when bound by VGAM63 RNA causes inhibition of translation of respective one or more VGAM63 host target proteins.

[7741] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM63 gene, herein designated VGAM GENE, on one or more VGAM63 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7742] It is yet further appreciated that a function of VGAM63 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM63 include diagnosis, prevention and

treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM63 correlate with, and may be deduced from, the identity of the host target genes which VGAM63 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7743] Nucleotide sequences of the VGAM63 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM63 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM63 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM63 are further described hereinbelow with reference to Table 1.

[7744] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM63 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM63 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7745] As mentioned hereinabove with reference to Fig. 1, a function of VGAM63 gene, herein designated VGAM is inhibition of expression of VGAM63 target genes. It is ap-

preciated that specific functions, and accordingly utilities, of VGAM63 correlate with, and may be deduced from, the identity of the target genes which VGAM63 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7746] KIAA0061 (Accession XM_043094) is a VGAM63 host target gene. KIAA0061 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0061, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0061 BINDING SITE, designated SEQ ID:33890, to the nucleotide sequence of VGAM63 RNA, herein designated VGAM RNA, also designated SEQ ID:2774.

[7747] A function of VGAM63 is therefore inhibition of KIAA0061 (Accession XM_043094). Accordingly, utilities of VGAM63 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0061. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 64 (VGAM64) viral gene, which modulates expression of re-

spective host target genes thereof, the function and utility of which host target genes is known in the art.

[7748] VGAM64 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM64 was detected is described hereinabove with reference to Figs. 1–8.

[7749] VGAM64 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7750] VGAM64 gene encodes a VGAM64 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM64 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM64 precursor RNA is designated SEQ ID:50, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:50 is located at position 146673 relative to the genome of Invertebrate Iridescent Virus 6.

[7751] VGAM64 precursor RNA folds onto itself, forming VGAM64 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7752] An enzyme complex designated DICER COMPLEX, `dices` the VGAM64 folded precursor RNA into VGAM64 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM64 RNA is designated SEQ ID:2775, and is provided hereinbelow with reference to the sequence listing part.

[7753] VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM64 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7754] VGAM64 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM64 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM64 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[7755] The complementary binding of VGAM64 RNA, herein designated VGAM RNA, to host target binding sites on VGAM64 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM64 host target RNA into VGAM64 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7756] It is appreciated that VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM64 host target genes. The mRNA of each one of this plurality of VGAM64 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM64 RNA, herein designated VGAM RNA, and which when bound by VGAM64 RNA causes inhibition of translation of respective one or more VGAM64 host target proteins.

[7757] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM64 gene, herein designated VGAM GENE, on one or

more VGAM64 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7758] It is yet further appreciated that a function of VGAM64 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM64 correlate with, and may be deduced from, the identity of the host target genes which VGAM64 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7759] Nucleotide sequences of the VGAM64 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM64 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM64 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM64 are further de-
scribed hereinbelow with reference to Table 1.

[7760] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM64 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM64 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[7761] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM64 gene, herein designated VGAM is in-
hibition of expression of VGAM64 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM64 correlate with, and may be deduced from, the
identity of the target genes which VGAM64 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[7762] Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774) is a
VGAM64 host target gene. ANK1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by ANK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ANK1 BINDING SITE, designated SEQ ID:30284, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7763] A function of VGAM64 is therefore inhibition of Ankyrin 1, Erythrocytic (ANK1, Accession XM_016774). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ANK1. ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933) is another VGAM64 host target gene. ATP8B2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8B2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8B2 BINDING SITE, designated SEQ ID:32511, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7764] Another function of VGAM64 is therefore inhibition of ATPase, Class I, Type 8B, Member 2 (ATP8B2, Accession XM_036933). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8B2. BLAME (Accession NM_020125) is another VGAM64 host target gene. BLAME BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21306, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7765] Another function of VGAM64 is therefore inhibition of BLAME (Accession NM_020125). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. Caudal Type Homeo Box Transcription Factor 1 (CDX1, Accession NM_001804) is another VGAM64 host target gene. CDX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CDX1, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDX1 BINDING SITE, designated SEQ ID:7557, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7766] Another function of VGAM64 is therefore inhibition of Caudal Type Homeo Box Transcription Factor 1 (CDX1, Accession NM_001804), a gene which could play a role in the terminal differentiation of the intestine. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDX1. The function of CDX1 has been established by previous studies. CDX1 is a member of the caudal-type homeo box family of genes. These are cognates of the *Drosophila* 'caudal' gene, which is required for anterior-posterior regional identity. Homologous genes have been found in mouse, rat, chicken, and *Xenopus*. CDX3 (OMIM Ref. No. 600297) is the human caudal-type homeo box gene located on chromosome 13. The caudal-type homeo box genes are members of the hexapeptide (HEX) super-class, containing a conserved hexapeptide motif upstream of the homeodomain, usually separated from the homeodomain by an intron. Bonner et al. (1995) isolated the

human CDX1 gene from a small intestine cDNA library using a murine Cdx1 cDNA probe. The nucleotide sequence of CDX1 was 81% identical to murine Cdx1 and predicted a 265-amino acid protein with 85% identity to the mouse protein (or 98% identity when the conservative amino acid changes were included). The murine Cdx1 gene maps to mouse chromosome 18, near Csfmr and Pdgfrb, in a region of conserved synteny with human 5q31-q33. Bonner et al. (1995) demonstrated that the human cognate of Cdx1 maps to a cosmid contig from 5q31-q33, placing CDX1 approximately 100 kb distal to CSF1R (OMIM Ref. No. 164770). (CSF1R had been mapped to 5q33.2-q33.3.) Northern analysis indicated that expression of CDX1 in adults appears to be limited to the intestine and colon, suggesting a possible role in the terminal differentiation of the intestine. In the mouse, Cdx1 is expressed along the embryonic axis from day 7.5 postcoitum until day 12, by which time the anterior limit of expression has regressed from the hindbrain level to the forelimb bud region. To assign a functional role for Cdx1 in murine embryonic development, Subramanian et al. (1995) inactivated the gene via homologous recombination. Viable fertile homozygous mutant mice were obtained that showed

anterior homeotic transformations of vertebrae. These abnormalities were concomitant with posterior shifts of Hox gene expression domains in the somitic mesoderm. The authors stated that the presence of putative Cdx1-binding sites in Hox gene control regions as well as in vitro trans-activation of Hoxa7 indicates a direct regulation.

[7767] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7768] Subramanian, V.; Meyer, B. I.; Gruss, P. : Disruption of the murine homeobox gene Cdx1 affects axial skeletal identities by altering the mesodermal expression domains of Hox genes. Cell 83: 641–653, 1995. ; and

[7769] Treacher Collins Syndrome Collaborative Group : Positional cloning of a gene involved in the pathogenesis of Treacher Collins syndrome. Nature Genet. 12: 130–136, 1996.

[7770] Further studies establishing the function and utilities of CDX1 are found in John Hopkins OMIM database record ID 600746, and in cited publications numbered 7584–758 and 3538 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Diacylglycerol O-acyltransferase Homolog 2 (mouse)

(DGAT2, Accession NM_032564) is another VGAM64 host target gene. DGAT2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DGAT2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGAT2 BINDING SITE, designated SEQ ID:26290, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7771] Another function of VGAM64 is therefore inhibition of Diacylglycerol O-acyltransferase Homolog 2 (mouse) (DGAT2, Accession NM_032564). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGAT2. Fucosyltransferase 3 (galactoside 3(4)-L-fucosyltransferase, Lewis Blood Group Included) (FUT3, Accession NM_000149) is another VGAM64 host target gene. FUT3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FUT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of FUT3 BINDING SITE, designated SEQ ID:5647, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7772] Another function of VGAM64 is therefore inhibition of Fucosyltransferase 3 (galactoside 3(4)-L-fucosyltransferase, Lewis Blood Group Included) (FUT3, Accession NM_000149), a gene which may catalyze alpha-1,3 and alpha-1,4 glycosidic linkages involved in the expression of vim-2, lewis a, lewis b, sialyl lewis x and lewis x/ssea-1 antigens. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT3. The function of FUT3 has been established by previous studies. The Lewis system involves genetically variable antigens in the body fluids and only secondarily are the antigens absorbed to red cells. Grollman et al. (1969) showed that Lewis-negative women lack a specific fucosyltransferase which is present in the milk of Lewis-positive women. The enzyme is apparently required for synthesis of the structural determinants of both Lewis (a) and Lewis (b) specificity. The same enzyme is involved in the synthesis of milk oligosaccharides, because 2 oligosaccharides containing the relevant

linkage were absent from the milk of Lewis-negative women. Grubb (1953) provided the ingenious interpretation of the interactions between the Les locus determining presence/absence of Lewis substance in the saliva and on red cells and the Se locus (OMIM Ref. No. 182100) determining secretion of ABH blood group substances in the saliva and Le(a) or Le(b) expression in red cells. In transfusion medicine, it has been found that some individuals who type as Lewis-positive on erythrocytes can change their erythrocyte phenotype to Lewis-negative during diseases or during pregnancy. Orntoft et al. (1996) noted that these patients have been named non-genuine Lewis-negative individuals as they have alpha-1-4 fucosyltransferase activity in saliva. Due to this phenomenon, the Lewis-negative phenotype is more common among cancer patients (approximately 20%) than among healthy individuals (approximately 8%). Orntoft et al. (1996) examined the mutational spectrum of the Lewis gene in Denmark and found 6 different mutations. Five, 59T-G (L20R; 111100.0001), 202T-C (W68R), 314C-T (T105M), 508G-A (G170S; 111100.0001), and 1067T-A (I356K), were frequent, and 1, 445C-A (L146M), was only detected in 1 of 40 individuals. The authors demonstrated that the nu-

cleotide 202 and 314 mutations were located on the same allele. COS-7 cells transfected with an allele having the 202/314 mutations lacked enzyme activity. Lewis-negative patients, whose erythrocytes converted from Lewis-positive to Lewis-negative during their disease, showed FUT3 heterozygosity significantly more often than did others (p less than 0.05). Pang et al. (1998) identified 5 novel missense mutations in the FUT3 gene in African (Xhosa) and Caucasian subjects in South Africa.

[7773] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7774] Grollman, E. F.; Kobata, A.; Ginsburg, V. : An enzymatic basis for Lewis blood types in man. J. Clin. Invest. 48: 1489-1494, 1969. ; and

[7775] Orntoft, T. F.; Vestergaard, E. M.; Holmes, E.; Jakobsen, J. S.; Grunnet, N.; Mortensen, M.; Johnson, P.; Bross, P.; Gregersen, N.; Skorstengaard, K.; Jensen, U. B.; Bolund, L.; Wolf, H.

[7776] Further studies establishing the function and utilities of FUT3 are found in John Hopkins OMIM database record ID 111100, and in cited publications numbered 10702, 10703-24 and 3780-244 listed in the bibliography sec-

tion hereinbelow, which are also hereby incorporated by reference. Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480) is another VGAM64 host target gene. FUT8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FUT8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUT8 BINDING SITE, designated SEQ ID:10796, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7777] Another function of VGAM64 is therefore inhibition of Fucosyltransferase 8 (alpha (1,6) Fucosyltransferase) (FUT8, Accession NM_004480), a gene which transfers fucose to N-linked type complex glycopeptides from GDP-Fuc; functions in asparagine-linked glycoprotein oligosaccharide synthesis. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUT8. The function of FUT8 has been established by previous studies. Alpha-1,6-fucosyltransferase catalyzes the transfer of fucose to N-linked glycopeptides. Yanagidani et al. (1997) purified a

60-kD alpha-1,6-fucosyltransferase from a human gastric cancer cell line and used peptide sequences to clone the FUT8 cDNA. The gene encodes a 575-amino acid polypeptide that has little sequence homology to other human fucosyltransferases. Costache et al. (1997) analyzed FUT sequences in the GenBank expressed sequence tag (EST) database and noted that FUT8 is represented more frequently, possibly indicating that it has a higher level of expression than other FUT genes. They also identified a slightly longer alternatively spliced variant of FUT8 from retina cDNA libraries. Costache et al. (1997) reviewed the evolutionary relationships among known fucosyltransferase genes. The phylogenetic branch point for FUT8 was the oldest.

[7778] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7779] Costache, M.; Apoil, P.-A.; Cailleau, A.; Elmgren, A.; Larson, G.; Henry, S.; Blancher, A.; Iordachescu, D.; Oriol, R.; Mollicone, R. : Evolution of fucosyltransferase genes in vertebrates. *J. Biol. Chem.* 272: 29721–29728, 1997. ; and

[7780] Yanagidani, S.; Uozumi, N.; Ihara, Y.; Miyoshi, E.; Yamaguchi, N.; Taniguchi, N. : Purification and cDNA cloning

of GDP-L-Fuc:N-acetyl-beta-D-glucosaminide:alpha-1-6 fucosyltransferase.

[7781] Further studies establishing the function and utilities of FUT8 are found in John Hopkins OMIM database record ID 602589, and in cited publications numbered 8635-8636 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Gap Junction Protein, Alpha 5, 40kDa (connexin 40) (GJA5, Accession XM_059147) is another VGAM64 host target gene. GJA5 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GJA5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GJA5 BINDING SITE, designated SEQ ID:36902, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7782] Another function of VGAM64 is therefore inhibition of Gap Junction Protein, Alpha 5, 40kDa (connexin 40) (GJA5, Accession XM_059147), a gene which may facilitate cardiac impulse conduction. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GJA5. The function of

GJA5 has been established by previous studies. See 121011 for a general discussion of the connexin gene family. Kanter et al. (1992) demonstrated that canine ventricular myocytes express 3 distinct gap junction proteins, Cx40, Cx43 (GJA1; 121013), and Cx45. Kanter et al. (1994) used PCR with primers based on rat and dog Cx40 to clone human CX40. The CX40 gene has a 5-prime untranslated exon and 1 coding exon, and encodes a predicted 358-amino acid protein whose sequence is 82% identical to that of the rat and mouse CX40 protein. Northern blot analysis showed that CX40 mRNA is expressed as an approximately 3.3-kb transcript in ventricular myocardium. In immunofluorescence studies, CX40 localized to intercalated disc regions of the left ventricle, which join cardiac myocytes and contain gap junctions. The migration of lymphocytes from the circulation into tissues involves a number of adhesion molecules and the expression of new molecules. Gap junctions facilitate cell-to-cell adhesion and provide pathways for direct intercellular communication. Oviedo-Orta et al. (2000) noted that GJA1 is expressed in a number of lymphoid organs. By RT-PCR, Western blot, and flow cytometric analyses, they showed that lymphocytes express GJA1 and GJA5, but not

GJB2 (OMIM Ref. No. 121011), GJB1 (OMIM Ref. No. 304040), GJA4 (OMIM Ref. No. 121012), or GJA7; GJA5 expression was restricted to tonsillar T and B lymphocytes. Flow cytometric analysis showed that GJA1 and GJA5 expression increases after mitogenic stimulation. Extracellular connexin mimetic peptide blocked dye transfer between lymphocyte subpopulations, and gap junction inhibitors decreased the production of IgM in cocultured T and B lymphocytes. The results identified gap junction proteins as important cell surface components that modulate immune responses.

[7783] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7784] Kanter, H. L.; Saffitz, J. E.; Beyer, E. C. : Cardiac myocytes express multiple gap junction proteins. *Circ. Res.* 70: 438–444, 1992. ; and

[7785] Oviedo–Orta, E.; Hoy, T.; Evans, W. H. : Intercellular communication in the immune system: differential expression of connexin40 and 43, and perturbation of gap junction channel function.

[7786] Further studies establishing the function and utilities of GJA5 are found in John Hopkins OMIM database record ID

121013, and in cited publications numbered 11840–1184 and 11839 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Inositol Polyphosphate–5–phosphatase, 145kDa (INPP5D, Accession XM_096169) is another VGAM64 host target gene. INPP5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by INPP5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INPP5D BINDING SITE, designated SEQ ID:40306, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7787] Another function of VGAM64 is therefore inhibition of Inositol Polyphosphate–5–phosphatase, 145kDa (INPP5D, Accession XM_096169), a gene which hydrolyzes Ins(1,3,4,5)P₄ and PtdIns(3,4,5)P₃; contains an SH2–domain. Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INPP5D. The function of INPP5D has been established by previous studies. The phosphatidylinositols serve as precursors for a number of

different messenger molecules. Agonist stimulation of cells results in phosphatidylinositol turnover and the generation of inositol 1,4,5-triphosphate (Ins(1,4,5)P₃), which mobilizes intracellular calcium. The inositol-polyphosphate 5-phosphatase (INPP5) enzymes hydrolyze Ins(1,4,5)P₃ in a signal-terminating reaction. Known INPP5s include the 40-kD INPP5A (OMIM Ref. No. 600106), the 75-kD INPP5B (OMIM Ref. No. 147264), and the enzyme associated with Lowe oculocerebrorenal syndrome (OMIM Ref. No. 309000). Damen et al. (1996) cloned and sequenced a cDNA encoding a 145-kD protein from a mouse hematopoietic cell line; the protein became tyrosine phosphorylated and associated with SHC (OMIM Ref. No. 600560) after cytokine stimulation. Based on its domains and enzymatic activity, Damen et al. (1996) named this protein SHIP for 'SH2-containing inositol phosphatase. Liu et al. (1998) studied the expression of the Ship gene during mouse development. They found that the gene is expressed in late primitive-streak stage embryos (7.5 days post coitum), when hematopoiesis is thought to begin, and the expression is restricted to the hematopoietic lineage. In adult mice, Ship expression continues in most cells of hematopoietic origin, including

granulocytes, monocytes, and lymphocytes, and is also found in the spermatids of the testis. Furthermore, the level of Ship expression is developmentally regulated during T-cell maturation. These results suggested a possible role for Ship in the differentiation and maintenance of the hematopoietic lineages and in spermatogenesis. Animal model experiments lend further support to the function of INPP5D. Because Ship $-/-$ mice contain increased numbers of osteoclast precursors, i.e., macrophages, Takeshita et al. (2002) examined bones from these animals and found that osteoclast number was increased 2-fold. The increased number was the result of prolonged lifespan of these cells and hypersensitivity of precursors to macrophage colony-stimulating factor (M-CSF; 120420) and receptor activator of nuclear factor- κ B ligand (RANKL; 602642). Similar to the osteoclasts of Paget disease of bone (OMIM Ref. No. 602080), Ship $-/-$ osteoclasts were enlarged, containing upwards of 100 nuclei, and exhibited enhanced resorptive activity. Moreover, as in Paget disease, serum levels of interleukin-6 (OMIM Ref. No. 147620) were markedly increased in Ship $-/-$ mice. Consistent with accelerated resorptive activity, a 22% loss of bone-mineral density and a 49% decrease in fracture

energy were observed. Thus, SHIP negatively regulates osteoclast formation and function, and the absence of this enzyme results in severe osteoporosis

[7788] It is appreciated that the abovementioned animal model for INPP5D is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7789] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7790] Liu, Q.; Shalaby, F.; Jones, J.; Bouchard, D.; Dumont, D. J. : The SH2-containing inositol polyphosphate 5-phosphatase, Ship, is expressed during hematopoiesis and spermatogenesis. Blood 91: 2753–2759, 1998. ; and

[7791] Takeshita, S.; Namba, N.; Zhao, J. J.; Jiang, Y.; Genant, H. K.; Silva, M. J.; Brodt, M. D.; Helgason, C. D.; Kalesnikoff, J.; Rauh, M. J.; Humphries, R. K.; Krystal, G.; Teitelbaum, S.

[7792] Further studies establishing the function and utilities of INPP5D are found in John Hopkins OMIM database record ID 601582, and in cited publications numbered 6540–6550 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphorylase, Glycogen; Brain (PYGB, Accession

NM_002862) is another VGAM64 host target gene. PYGB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PYGB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PYGB BINDING SITE, designated SEQ ID:8768, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7793] Another function of VGAM64 is therefore inhibition of Phosphorylase, Glycogen; Brain (PYGB, Accession NM_002862). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PYGB. Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM_130845) is another VGAM64 host target gene. SNTB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNTB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNTB2 BINDING SITE, designated SEQ ID:28378, to the nucleotide sequence of

VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7794] Another function of VGAM64 is therefore inhibition of Syntrophin, Beta 2 (dystrophin-associated protein A1, 59kDa, basic component 2) (SNTB2, Accession NM_130845). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNTB2. Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362) is another VGAM64 host target gene. TIMP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIMP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMP3 BINDING SITE, designated SEQ ID:5933, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7795] Another function of VGAM64 is therefore inhibition of Tissue Inhibitor of Metalloproteinase 3 (Sorsby fundus dystrophy, pseudoinflammatory) (TIMP3, Accession NM_000362). Accordingly, utilities of VGAM64 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with TIMP3. Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession NM_003938) is another VGAM64 host target gene. AP3D1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by AP3D1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP3D1 BINDING SITE, designated SEQ ID:10049, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7796] Another function of VGAM64 is therefore inhibition of Adaptor-related Protein Complex 3, Delta 1 Subunit (AP3D1, Accession NM_003938). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP3D1. Bromodomain Containing 2 (BRD2, Accession NM_005104) is another VGAM64 host target gene. BRD2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BRD2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of BRD2 BINDING SITE, designated SEQ ID:11574, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7797] Another function of VGAM64 is therefore inhibition of Bromodomain Containing 2 (BRD2, Accession NM_005104). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BRD2. Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575) is another VGAM64 host target gene. C17orf31 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C17orf31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C17orf31 BINDING SITE, designated SEQ ID:19001, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7798] Another function of VGAM64 is therefore inhibition of Chromosome 17 Open Reading Frame 31 (C17orf31, Accession NM_017575). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with C17orf31. CG018 (Accession NM_052818) is another VGAM64 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CG018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27403, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7799] Another function of VGAM64 is therefore inhibition of CG018 (Accession NM_052818). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018. DKFZp434F142 (Accession NM_032254) is another VGAM64 host target gene. DKFZp434F142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434F142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434F142 BINDING SITE, designated SEQ ID:25994, to

the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7800] Another function of VGAM64 is therefore inhibition of DKFZp434F142 (Accession NM_032254). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434F142. DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM_028966) is another VGAM64 host target gene. DNAJC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAJC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAJC5 BINDING SITE, designated SEQ ID:30812, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7801] Another function of VGAM64 is therefore inhibition of DnaJ (Hsp40) Homolog, Subfamily C, Member 5 (DNAJC5, Accession XM_028966). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAJC5. FLJ11506 (Accession NM_024666) is another VGAM64 host target

gene. FLJ11506 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11506 BINDING SITE, designated SEQ ID:23967, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7802] Another function of VGAM64 is therefore inhibition of FLJ11506 (Accession NM_024666). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11506. FLJ12190 (Accession NM_025071) is another VGAM64 host target gene. FLJ12190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12190 BINDING SITE, designated SEQ ID:24667, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7803] Another function of VGAM64 is therefore inhibition of FLJ12190 (Accession NM_025071). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12190. FLJ14816 (Accession NM_032845) is another VGAM64 host target gene. FLJ14816 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14816, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14816 BINDING SITE, designated SEQ ID:26638, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7804] Another function of VGAM64 is therefore inhibition of FLJ14816 (Accession NM_032845). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14816. Interleukin 14 (IL14, Accession XM_170924) is another VGAM64 host target gene. IL14 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by IL14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IL14 BINDING SITE, designated SEQ ID:45704, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7805] Another function of VGAM64 is therefore inhibition of Interleukin 14 (IL14, Accession XM_170924). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IL14. KIAA0265 (Accession XM_045954) is another VGAM64 host target gene. KIAA0265 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0265, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0265 BINDING SITE, designated SEQ ID:34628, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7806] Another function of VGAM64 is therefore inhibition of KIAA0265 (Accession XM_045954). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA0265. KIAA0495 (Accession XM_031397) is another VGAM64 host target gene. KIAA0495 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0495, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0495 BINDING SITE, designated SEQ ID:31363, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7807] Another function of VGAM64 is therefore inhibition of KIAA0495 (Accession XM_031397). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0495. KIAA1045 (Accession XM_048592) is another VGAM64 host target gene. KIAA1045 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35200, to the nucleotide sequence of VGAM64 RNA, herein designated

VGAM RNA, also designated SEQ ID:2775.

[7808] Another function of VGAM64 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. KIAA1529 (Accession XM_047336) is another VGAM64 host target gene. KIAA1529 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1529, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1529 BINDING SITE, designated SEQ ID:34948, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7809] Another function of VGAM64 is therefore inhibition of KIAA1529 (Accession XM_047336). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1529. KIAA1719 (Accession XM_042936) is another VGAM64 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1719, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33819, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7810] Another function of VGAM64 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. LRG (Accession NM_052972) is another VGAM64 host target gene. LRG BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRG, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRG BINDING SITE, designated SEQ ID:27547, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7811] Another function of VGAM64 is therefore inhibition of LRG (Accession NM_052972). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with LRG. MGC23980 (Accession NM_145005) is another VGAM64 host target gene. MGC23980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23980 BINDING SITE, designated SEQ ID:29607, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7812] Another function of VGAM64 is therefore inhibition of MGC23980 (Accession NM_145005). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC23980. Mitochondrial Ribosomal Protein S10 (MRPS10, Accession NM_018141) is another VGAM64 host target gene. MRPS10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MRPS10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPS10 BINDING SITE,

designated SEQ ID:19939, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7813] Another function of VGAM64 is therefore inhibition of Mitochondrial Ribosomal Protein S10 (MRPS10, Accession NM_018141). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPS10. Nei Like 2 (E. coli) (NEIL2, Accession NM_145043) is another VGAM64 host target gene. NEIL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NEIL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEIL2 BINDING SITE, designated SEQ ID:29673, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7814] Another function of VGAM64 is therefore inhibition of Nei Like 2 (E. coli) (NEIL2, Accession NM_145043). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEIL2. Protein Kinase C and Casein Kinase Sub-

strate In Neurons 2 (PACSIN2, Accession NM_007229) is another VGAM64 host target gene. PACSIN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PACSIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PACSIN2 BINDING SITE, designated SEQ ID:14096, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7815] Another function of VGAM64 is therefore inhibition of Protein Kinase C and Casein Kinase Substrate In Neurons 2 (PACSIN2, Accession NM_007229). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PACSIN2. PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975) is another VGAM64 host target gene. PTK6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PTK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTK6 BINDING SITE, designated SEQ ID:12599, to the nu-

cleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7816] Another function of VGAM64 is therefore inhibition of PTK6 Protein Tyrosine Kinase 6 (PTK6, Accession NM_005975). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTK6. TAO1 (Accession NM_004783) is another VGAM64 host target gene. TAO1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAO1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAO1 BINDING SITE, designated SEQ ID:11190, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7817] Another function of VGAM64 is therefore inhibition of TAO1 (Accession NM_004783). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TAO1. LOC123591 (Accession XM_063741) is another VGAM64 host target gene. LOC123591 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of

mRNA encoded by LOC123591, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC123591 BINDING SITE, designated SEQ ID:37251, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7818] Another function of VGAM64 is therefore inhibition of LOC123591 (Accession XM_063741). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC123591. LOC143286 (Accession XM_096412) is another VGAM64 host target gene. LOC143286 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC143286, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143286 BINDING SITE, designated SEQ ID:40356, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7819] Another function of VGAM64 is therefore inhibition of LOC143286 (Accession XM_096412). Accordingly, utilities

of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143286. LOC150271 (Accession XM_097859) is another VGAM64 host target gene. LOC150271 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC150271, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150271 BINDING SITE, designated SEQ ID:41175, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7820] Another function of VGAM64 is therefore inhibition of LOC150271 (Accession XM_097859). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150271. LOC151176 (Accession XM_098016) is another VGAM64 host target gene. LOC151176 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151176, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC151176 BINDING SITE, designated SEQ ID:41315, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7821] Another function of VGAM64 is therefore inhibition of LOC151176 (Accession XM_098016). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151176. LOC196478 (Accession XM_113729) is another VGAM64 host target gene. LOC196478 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196478 BINDING SITE, designated SEQ ID:42379, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7822] Another function of VGAM64 is therefore inhibition of LOC196478 (Accession XM_113729). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196478. LOC254268 (Accession XM_170913) is another VGAM64 host target gene. LOC254268 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254268 BINDING SITE, designated SEQ ID:45692, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7823] Another function of VGAM64 is therefore inhibition of LOC254268 (Accession XM_170913). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254268. LOC56912 (Accession NM_020153) is another VGAM64 host target gene. LOC56912 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56912, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56912 BINDING SITE, designated SEQ ID:21364, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7824] Another function of VGAM64 is therefore inhibition of

LOC56912 (Accession NM_020153). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56912. LOC92710 (Accession XM_046811) is another VGAM64 host target gene. LOC92710 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92710, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92710 BINDING SITE, designated SEQ ID:34834, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7825] Another function of VGAM64 is therefore inhibition of LOC92710 (Accession XM_046811). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92710. LOC93190 (Accession XM_049705) is another VGAM64 host target gene. LOC93190 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC93190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC93190 BINDING SITE, designated SEQ ID:35488, to the nucleotide sequence of VGAM64 RNA, herein designated VGAM RNA, also designated SEQ ID:2775.

[7826] Another function of VGAM64 is therefore inhibition of LOC93190 (Accession XM_049705). Accordingly, utilities of VGAM64 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93190. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 65 (VGAM65) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7827] VGAM65 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM65 was detected is described hereinabove with reference to Figs. 1–8.

[7828] VGAM65 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM65 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[7829] VGAM65 gene encodes a VGAM65 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM65 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM65 precursor RNA is designated SEQ ID:51, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:51 is located at position 84924 relative to the genome of Invertebrate Iridescent Virus 6.

[7830] VGAM65 precursor RNA folds onto itself, forming VGAM65 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7831] An enzyme complex designated DICER COMPLEX, `dices` the VGAM65 folded precursor RNA into VGAM65 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 60%) nucleotide sequence of VGAM65 RNA is designated SEQ ID:2776, and is provided hereinbelow with reference to the sequence listing part.

[7832] VGAM65 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM65 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM65 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7833] VGAM65 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM65 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM65 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM65 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM65 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7834] The complementary binding of VGAM65 RNA, herein designated VGAM RNA, to host target binding sites on VGAM65 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM65 host target RNA into VGAM65 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7835] It is appreciated that VGAM65 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM65 host target genes. The mRNA of each one of this plurality of VGAM65 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM65 RNA, herein designated VGAM RNA, and which when bound by VGAM65 RNA causes inhibition of translation of respective one or more VGAM65 host target proteins.

[7836] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM65 gene, herein designated VGAM GENE, on one or more VGAM65 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7837] It is yet further appreciated that a function of VGAM65 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM65 correlate with, and may be deduced from, the identity of the host target genes which VGAM65 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7838] Nucleotide sequences of the VGAM65 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM65 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM65 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM65 are further described hereinbelow with reference to Table 1.

[7839] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM65 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM65 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7840] As mentioned hereinabove with reference to Fig. 1, a function of VGAM65 gene, herein designated VGAM is inhibition of expression of VGAM65 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM65 correlate with, and may be deduced from, the identity of the target genes which VGAM65 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7841] UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Accession NM_014256) is a VGAM65 host target gene. B3GNT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by B3GNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT3 BINDING SITE, designated SEQ ID:15534, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7842] A function of VGAM65 is therefore inhibition of UDP-GlcNAc:betaGal Beta-1,3-N-acetylglucosaminyltransferase 3 (B3GNT3, Accession NM_014256). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT3. 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870) is another VGAM65 host target gene. HTR4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HTR4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HTR4 BINDING SITE, designated SEQ ID:6546, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7843] Another function of VGAM65 is therefore inhibition of 5-hydroxytryptamine (serotonin) Receptor 4 (HTR4, Accession NM_000870), a gene which mediates calcium channel currents. Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HTR4. The function of HTR4 has been established by previous studies. The

5-hydroxytryptamine-4 receptor was first characterized by Dumuis et al. (1988) in mouse colliculi neurons. Subsequently, Eglen et al. (1995) showed that 5-HT₄ mediates widespread effects in central and peripheral nervous systems. Serotonin acts as a stimulant to atrial cardiac cells in only a few mammalian species including human, monkey, and pig but not rodents. Cells from human atrium respond to 5-HT stimulation by producing an L-type calcium current. Blondel et al. (1997) used PCR, based on primers to the central region of rat 5-HT₄ receptor, to clone a human 5-HT₄ receptor, which they called 5-HT_{4A}. Sequence analysis showed that this cDNA encodes a 387-amino acid polypeptide with 7 putative transmembrane domains and several potential regulatory sites. Blondel et al. (1997) found that 5-HT_{4A} is the same length and 93% identical to the shorter of the 2 alternately spliced forms of the rat 5-HT₄ receptor. RT-PCR analysis showed that the 5-HT_{4A} mRNA is expressed in human ileum, brain, and atrium, but not in the ventricle. COS-7 cells expressing the 5-HT₄ receptor respond to serotonin stimulation with pharmacologic profiles similar to those seen in human atrial myocytes, suggesting to Blondel et al. (1997) that 5-HT_{4A} is the protein responsible for the

serotonin responsiveness of the human atrium.

- [7844] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [7845] Claeyssen, S.; Faye, P.; Sebben, M.; Lemaire, S.; Bockaert, J.; Dumuis, A.; Taviaux, S. : Assignment of 5-hydroxytryptamine receptor (HTR4) to human chromosome 5 bands q31-to-q33 by in situ hybridization. *Cytogenet. Cell Genet.* 78: 133-134, 1997. ; and
- [7846] Dumuis, A.; Bouhelal, R.; Sebben, M.; Cory, R.; Bockaert, J. : A nonclassical 5-hydroxytryptamine receptor positively coupled with adenylate cyclase in the central nervous system. *Molec.*
- [7847] Further studies establishing the function and utilities of HTR4 are found in John Hopkins OMIM database record ID 602164, and in cited publications numbered 6342-6345 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PSA (Accession NM_021154) is another VGAM65 host target gene. PSA BINDING SITE1 and PSA BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PSA, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSA BINDING SITE1 and PSA BINDING SITE2, designated SEQ ID:22129 and SEQ ID:27738 respectively, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7848] Another function of VGAM65 is therefore inhibition of PSA (Accession NM_021154), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSA. The function of PSA has been established by previous studies. Tobler et al. (1997) cloned PSA from a human fetal brain cDNA library using the mouse PSA cDNA as probe. They established that translation is initiated at the second of 2 possible start codons, resulting in a deduced 875-amino acid protein with a molecular mass of 99 kD by SDS-PAGE. PSA contains a zinc-binding motif conserved among gluzincin aminopeptidases and shares 98% sequence identity with the mouse protein. Northern blot analysis detected ubiquitous expression of a 4.8-kb transcript, with highest expression in brain. By in situ hybridization of adult human brain sections, expres-

sion was localized to the perikaryon of neurons of the cortex and cerebellum. Using immunofluorescence localization of transfected HeLa cells, Tobler et al. (1997) found that PSA localizes to the perinuclear cytoplasm and shows a filamentous staining pattern. Bauer et al. (2001) cloned PSA cDNA from a human skeletal muscle library. Northern blot analysis detected major and minor transcripts of 4.8 and 4.2 kb, respectively. Huber et al. (1999) determined that PSA is identical to the metalloprotease MP100 that was originally isolated as a beta-secretase candidate from human brain by Schonlein et al. (1994). Huber et al. (1999) were able to colocalize and coimmunoprecipitate PSA with beta-amyloid precursor protein (OMIM Ref. No. 104760); however, PSA did not increase production of the amyloid-beta peptide in cotransfected cells. By RT-PCR, but not by Northern blot analysis, Bauer et al. (2001) found that PSA was upregulated in human leukemic cells following vitamin D stimulation.

[7849] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7850] Huber, G.; Thompson, A.; Gruninger, F.; Mechler, H.; Hochstrasser, R.; Hauri, H.-P.; Malherbe, P. : cDNA cloning

and molecular characterization of human brain metallo-protease MP100: a beta-secretase candidate? J. Neurochem. 72: 1215-1223, 1999. ; and

[7851] Tobler, A. R.; Constam, D. B.; Schmitt-Graff, A.; Malipiero, U.; Schlapbach, R.; Fontana, A. : Cloning of the human puromycin-sensitive aminopeptidase and evidence for expression in neu.

[7852] Further studies establishing the function and utilities of PSA are found in John Hopkins OMIM database record ID 606793, and in cited publications numbered 5485-5490 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp761B0514 (Accession NM_032289) is another VGAM65 host target gene. DKFZp761B0514 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761B0514, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761B0514 BINDING SITE, designated SEQ ID:26052, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7853] Another function of VGAM65 is therefore inhibition of DK-

FZp761B0514 (Accession NM_032289). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761B0514. FLJ10290 (Accession NM_018047) is another VGAM65 host target gene. FLJ10290 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10290 BINDING SITE, designated SEQ ID:19798, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7854] Another function of VGAM65 is therefore inhibition of FLJ10290 (Accession NM_018047). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10290. KIAA1841 (Accession XM_087056) is another VGAM65 host target gene. KIAA1841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA1841 BINDING SITE, designated SEQ ID:39028, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7855] Another function of VGAM65 is therefore inhibition of KIAA1841 (Accession XM_087056). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1841. UQCR (Accession NM_006830) is another VGAM65 host target gene. UQCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UQCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UQCR BINDING SITE, designated SEQ ID:13710, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7856] Another function of VGAM65 is therefore inhibition of UQCR (Accession NM_006830). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UQCR. Zinc Finger, Imprinted 3 (ZIM3, Accession NM_052882) is

another VGAM65 host target gene. ZIM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZIM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZIM3 BINDING SITE, designated SEQ ID:27462, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7857] Another function of VGAM65 is therefore inhibition of Zinc Finger, Imprinted 3 (ZIM3, Accession NM_052882). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZIM3. LOC113523 (Accession XM_054378) is another VGAM65 host target gene. LOC113523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC113523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC113523 BINDING SITE, designated SEQ ID:36156, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7858] Another function of VGAM65 is therefore inhibition of LOC113523 (Accession XM_054378). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC113523. LOC143465 (Accession XM_096430) is another VGAM65 host target gene. LOC143465 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143465, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143465 BINDING SITE, designated SEQ ID:40366, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7859] Another function of VGAM65 is therefore inhibition of LOC143465 (Accession XM_096430). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143465. LOC92539 (Accession XM_045632) is another VGAM65 host target gene. LOC92539 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92539, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92539 BINDING SITE, designated SEQ ID:34505, to the nucleotide sequence of VGAM65 RNA, herein designated VGAM RNA, also designated SEQ ID:2776.

[7860] Another function of VGAM65 is therefore inhibition of LOC92539 (Accession XM_045632). Accordingly, utilities of VGAM65 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92539. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 66 (VGAM66) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7861] VGAM66 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM66 was detected is described hereinabove with reference to Figs. 1–8.

[7862] VGAM66 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM66 host target gene, herein designated

VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7863] VGAM66 gene encodes a VGAM66 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM66 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM66 precursor RNA is designated SEQ ID:52, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:52 is located at position 112517 relative to the genome of Invertebrate Iridescent Virus 6.

[7864] VGAM66 precursor RNA folds onto itself, forming VGAM66 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7865] An enzyme complex designated DICER COMPLEX, `dices` the VGAM66 folded precursor RNA into VGAM66 RNA,

herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM66 RNA is designated SEQ ID:2777, and is provided hereinbelow with reference to the sequence listing part.

[7866] VGAM66 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM66 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM66 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7867] VGAM66 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM66 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM66 RNA is an accurate or a partial in-

versed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM66 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM66 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7868] The complementary binding of VGAM66 RNA, herein designated VGAM RNA, to host target binding sites on VGAM66 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM66 host target RNA into VGAM66 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7869] It is appreciated that VGAM66 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM66 host target genes. The mRNA of each one of this plurality of VGAM66 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM66 RNA, herein designated VGAM RNA, and which when bound by VGAM66 RNA causes inhibition of translation of respective one or more VGAM66 host target proteins.

[7870] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM66 gene, herein designated VGAM GENE, on one or more VGAM66 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although spe-

cific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7871] It is yet further appreciated that a function of VGAM66 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM66 correlate with, and may be deduced from, the identity of the host target genes which VGAM66 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7872] Nucleotide sequences of the VGAM66 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM66 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM66 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM66 are further described hereinbelow with reference to Table 1.

[7873] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM66 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM66 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7874] As mentioned hereinabove with reference to Fig. 1, a function of VGAM66 gene, herein designated VGAM is inhibition of expression of VGAM66 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM66 correlate with, and may be deduced from, the identity of the target genes which VGAM66 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7875] Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM_002074) is a VGAM66 host target gene. GNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNB1 BINDING SITE, designated SEQ ID:7852, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7876] A function of VGAM66 is therefore inhibition of Guanine Nucleotide Binding Protein (G protein), Beta Polypeptide 1 (GNB1, Accession NM_002074). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNB1.

Lecithin Retinol Acyltransferase

(phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181) is another VGAM66 host target gene. LRAT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LRAT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRAT BINDING SITE, designated SEQ ID:30184, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7877] Another function of VGAM66 is therefore inhibition of Lecithin Retinol Acyltransferase (phosphatidylcholine--retinol O-acyltransferase) (LRAT, Accession XM_011181). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRAT. Retinal Pigment Epithelium-specific Protein 65kDa (RPE65, Accession

NM_000329) is another VGAM66 host target gene. RPE65 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RPE65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RPE65 BINDING SITE, designated SEQ ID:5871, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7878] Another function of VGAM66 is therefore inhibition of Retinal Pigment Epithelium-specific Protein 65kDa (RPE65, Accession NM_000329), a gene which May play a role in vitamin-A metabolism of the retina. Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RPE65. The function of RPE65 has been established by previous studies. The retinal pigment epithelium (RPE) is a monolayer simple epithelium apposed to the outer surface of the retinal photoreceptor cells. It is involved in many aspects of outer retinal metabolism that are essential to the continued maintenance of the photoreceptor cells, including many RPE-specific functions such as the retinoid visual cycle and photoreceptor outer segment disk phago-

cytosis and recycling. Hamel et al. (1993) characterized and cloned a unique RPE-specific microsomal protein, RPE65, that is conserved in vertebrates and was a candidate for the site of mutation in hereditary retinal disorders implicating the RPE. Using a human/hamster hybrid panel, Hamel et al. (1994) mapped the human RPE65 gene to chromosome 1 and, by fluorescence in situ hybridization, refined the localization to 1p31. Using interspecific back-cross analysis, they mapped the mouse Rpe65 gene to the distal portion of chromosome 3. Animal model experiments lend further support to the function of RPE65. Aguirre et al. (1998) described a 4-bp deletion in the RPE65 gene in a form of retinal dystrophy in dogs of the Swedish Briard breed. The disorder was initially described by Narfstrom et al. (1989) as a stationary disorder analogous to human congenital stationary night blindness (CSNB). The disorder was later described as having a progressive component and was termed hereditary retinal dystrophy (Wrigstad et al., 1994). Aguirre et al. (1998) studied 10 Briard dogs affected with what has been called CSNB in the U.S. The dogs originated from stock in the U.S., Canada, and France. Identification of the same mutation (a homozygous 4-bp deletion resulting in frameshift

and a premature stop codon that truncates the protein)
suggested a founder effect

[7879] It is appreciated that the abovementioned animal model for RPE65 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[7880] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7881] Hamel, C. P.; Jenkins, N. A.; Gilbert, D. J.; Copeland, N. G.; Redmond, T. M. : The gene for the retinal pigment epithelium-specific protein RPE65 is localized to human 1p31 and mouse 3. Genomics 20: 509–512, 1994. ; and

[7882] Aguirre, G. D.; Baldwin, V.; Pearce-Kelling, S.; Narfstrom, K.; Ray, K.; Acland, G. M. : Congenital stationary night blindness in the dog: common mutation in the RPE65 gene indicates found.

[7883] Further studies establishing the function and utilities of RPE65 are found in John Hopkins OMIM database record ID 180069, and in cited publications numbered 10465–1047 and 10072–10076 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 4, Sodium Bicarbonate

Cotransporter, Member 7 (SLC4A7, Accession NM_003615) is another VGAM66 host target gene. SLC4A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC4A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC4A7 BINDING SITE, designated SEQ ID:9674, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7884] Another function of VGAM66 is therefore inhibition of Solute Carrier Family 4, Sodium Bicarbonate Cotransporter, Member 7 (SLC4A7, Accession NM_003615), a gene which mediates the coupled movement of sodium and bicarbonate ions across the plasma membrane. Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC4A7. The function of SLC4A7 has been established by previous studies. By searching an EST database for sequences related to the pNBC variant of NBC1 (OMIM Ref. No. SLC4A4), Pushkin et al. (1999) identified ESTs encoding SLC4A7, which they called NBC3. They isolated human

muscle cDNAs representing a full-length NBC3 coding sequence. The predicted 1,214-amino acid muscle NBC3 variant, which the authors referred to as mNBC3, contains 12 putative transmembrane domains, with cytoplasmic N and C termini. mNBC3 has 1 putative stilbene-binding motif, numerous potential intracellular phosphorylation sites, potential sites for myristylation and amidation, and potential N-linked glycosylation sites in the exofacial loops between transmembrane domains 1 and 2, and 5 and 6. mNBC3 shares 78% amino acid sequence homology with the NBC2 variant (Ishibashi et al., 1998) of SLC4A7, 46% homology with the kNBC variant of NBC1, 39% homology with the pNBC variant of NBC1, and 29% homology with AE3 (SLC4A3; 106195). Expression of mNBC3 in *Xenopus* oocytes demonstrated that it is a stilbene-insensitive 5-(N-ethyl-N-isopropyl)-amiloride (EIPA)-inhibitable NBC. The SLC4A7 gene spans approximately 80 kb and contains 25 exons. Northern blot analysis of a number of human tissues detected an approximately 7.8-kb mNBC3 transcript only in skeletal muscle and heart. Burnham et al. (2000) stated that the NBC2 (Ishibashi et al., 1998) and mNBC3 (Pushkin et al., 1999) cDNAs share several kb of identical sequence. Although

the deduced protein sequences differ in their N and C termini and each protein contains an interior region not present in the other, the corresponding blocks share more than 99% identity. Thus, Burnham et al. (2000) suggested that NBC2 and mNBC3 are encoded by the same gene.

Burnham et al. (2000) isolated a human melanoma cell cDNA that encodes a protein containing elements previously thought to be characteristic of each of the variants NBC2 and mNBC3. Northern blot analysis of several human tissues using a probe specific to NBC2 detected expression mainly in lymph node and brain. Northern blot analysis using a probe specific to mNBC3 showed highest expression in skeletal muscle and heart and lower expression in lymph node, whole brain, adrenal gland, trachea, thyroid, stomach, pancreas, kidney, liver, lung, and placenta. Burnham et al. (2000) concluded that the melanoma cell, NBC2, and mNBC3 cDNAs represent 3 alternate transcripts of the SLC4A7 gene, which they called NBC2

[7885] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7886] Pushkin, A.; Abuladze, N.; Lee, I.; Newman, D.; Hwang, J.;

Kurtz, I. : Mapping of the human NBC3 (SLC4A7) gene to chromosome 3p22. Genomics 57: 321–322, 1999. Note: Correction: Genomics 58: 216 and 321–322, 1999. ; and

[7887] Soleimani, M.; Burnham, C. E. : Physiologic and molecular aspects of the Na(+):HCO(3-) cotransporter in health and disease processes. Kidney Int. 57: 371–384, 2000.

[7888] Further studies establishing the function and utilities of SLC4A7 are found in John Hopkins OMIM database record ID 603353, and in cited publications numbered 1083–108 and 7959 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Angiotensin Like 2 (AMOTL2, Accession NM_016201) is another VGAM66 host target gene. AMOTL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL2 BINDING SITE, designated SEQ ID:18295, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7889] Another function of VGAM66 is therefore inhibition of Angiotensin Like 2 (AMOTL2, Accession NM_016201). Ac-

cordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL2. CG018 (Accession NM_052818) is another VGAM66 host target gene. CG018 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CG018, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CG018 BINDING SITE, designated SEQ ID:27406, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7890] Another function of VGAM66 is therefore inhibition of CG018 (Accession NM_052818). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CG018. KIAA0441 (Accession NM_014797) is another VGAM66 host target gene. KIAA0441 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0441, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0441 BINDING SITE,

designated SEQ ID:16714, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7891] Another function of VGAM66 is therefore inhibition of KIAA0441 (Accession NM_014797). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0441. KIAA0470 (Accession NM_014812) is another VGAM66 host target gene. KIAA0470 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0470, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0470 BINDING SITE, designated SEQ ID:16778, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7892] Another function of VGAM66 is therefore inhibition of KIAA0470 (Accession NM_014812). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0470. KIAA1712 (Accession XM_041497) is another VGAM66 host target gene. KIAA1712 BINDING SITE is

HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1712, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1712 BINDING SITE, designated SEQ ID:33541, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7893] Another function of VGAM66 is therefore inhibition of KIAA1712 (Accession XM_041497). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1712. NET-6 (Accession NM_014399) is another VGAM66 host target gene. NET-6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NET-6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NET-6 BINDING SITE, designated SEQ ID:15742, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7894] Another function of VGAM66 is therefore inhibition of

NET-6 (Accession NM_014399). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NET-6. RCD-8 (Accession NM_014329) is another VGAM66 host target gene. RCD-8 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCD-8, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCD-8 BINDING SITE, designated SEQ ID:15639, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7895] Another function of VGAM66 is therefore inhibition of RCD-8 (Accession NM_014329). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCD-8. LOC127281 (Accession XM_059128) is another VGAM66 host target gene. LOC127281 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127281, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC127281 BINDING SITE, designated SEQ ID:36891, to the nucleotide sequence of VGAM66 RNA, herein designated VGAM RNA, also designated SEQ ID:2777.

[7896] Another function of VGAM66 is therefore inhibition of LOC127281 (Accession XM_059128). Accordingly, utilities of VGAM66 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127281. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 67 (VGAM67) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7897] VGAM67 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM67 was detected is described hereinabove with reference to Figs. 1–8.

[7898] VGAM67 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[7899] VGAM67 gene encodes a VGAM67 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM67 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM67 precursor RNA is designated SEQ ID:53, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:53 is located at position 58356 relative to the genome of Invertebrate Iridescent Virus 6.

[7900] VGAM67 precursor RNA folds onto itself, forming VGAM67 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7901] An enzyme complex designated DICER COMPLEX, `dices` the VGAM67 folded precursor RNA into VGAM67 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM67 RNA is designated SEQ ID:2778, and is provided hereinbelow with reference to the sequence listing part.

[7902] VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM67 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7903] VGAM67 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM67 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of

each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM67 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7904] The complementary binding of VGAM67 RNA, herein designated VGAM RNA, to host target binding sites on VGAM67 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM67 host target RNA into VGAM67 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7905] It is appreciated that VGAM67 host target gene, herein

designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM67 host target genes. The mRNA of each one of this plurality of VGAM67 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM67 RNA, herein designated VGAM RNA, and which when bound by VGAM67 RNA causes inhibition of translation of respective one or more VGAM67 host target proteins.

[7906] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM67 gene, herein designated VGAM GENE, on one or more VGAM67 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA

genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7907] It is yet further appreciated that a function of VGAM67 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM67 correlate with, and may be deduced from, the identity of the host target genes which VGAM67 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7908] Nucleotide sequences of the VGAM67 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM67 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM67 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM67 are further described hereinbelow with reference to Table 1.

[7909] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM67 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM67 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7910] As mentioned hereinabove with reference to Fig. 1, a function of VGAM67 gene, herein designated VGAM is inhibition of expression of VGAM67 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM67 correlate with, and may be deduced from, the identity of the target genes which VGAM67 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7911] Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529) is a VGAM67 host target gene. MLLT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT3 BINDING SITE, designated SEQ ID:10869, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7912] A function of VGAM67 is therefore inhibition of Myeloid/

lymphoid Or Mixed-lineage Leukemia (trithorax homolog, *Drosophila*); Translocated To, 3 (MLLT3, Accession NM_004529), a gene which is Serine and proline rich protein. Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT3. The function of MLLT3 has been established by previous studies. Nakamura et al. (1993) found that the AF4 gene on chromosome 4q21 (OMIM Ref. No. 159557) that is fused with the ALL1 gene (OMIM Ref. No. 159555) in patients with acute lymphoblastic leukemia and translocation t(4;11)(q21;q23) and the gene on chromosome 9 that is fused with the ALL1 gene on chromosome 11 in patients with leukemia and the t(9;11)(p22;q23) show high sequence homology with the ENL gene (OMIM Ref. No. 159556) on chromosome 19 which is fused to the ALL1 gene in patients with leukemia and the translocation t(11;19)(q23;p13). They found further that the protein products of the AF4, AF9, and ENL genes contained nuclear targeting sequences as well as serine-rich and proline-rich regions. Stretches abundant in basic amino acids were also present in the 3 proteins. These results indicated that the different proteins fused to ALL1 polypeptides in leukemia provide sim-

ilar functional domains. This gene is also symbolized MLLT3. The human AF9 gene is one of the most common fusion partner genes with the ALL1 gene at 11q23 (also called MLL), resulting in the t(9;11)(p22;q23). The AF9 gene is more than 100 kb, and 2 patient breakpoint cluster regions (BCRs) have been identified; BCR1 is within intron 4, previously called site A, whereas BCR2 or site B spans introns 7 and 8. Strissel et al. (2000) defined the exon–intron boundaries and identified several different structural elements in AF9, including a colocalizing in vivo DNA topo II cleavage site and an in vitro DNase I hypersensitive (DNase I HS) site in intron 7 in BCR2. Reversibility experiments demonstrated a religation of the topo II cleavage sites. In addition, 2 scaffold associated regions (SARs) are located centromeric to the topo II and DNase I HS cleavage sites and border breakpoint regions in 2 leukemic cell lines: SAR1 is located in intron 4, whereas SAR2 encompasses parts of exons 5–7. The authors thus demonstrated that the patient breakpoint regions of AF9 share the same structural elements as the MLL BCR, and they proposed a DNA breakage and repair model for non-homologous recombination between MLL and its partner genes, particularly AF9.

- [7913] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [7914] Nakamura, T.; Alder, H.; Gu, Y.; Prasad, R.; Canaani, O.; Kamada, N.; Gale, R. P.; Lange, B.; Crist, W. M.; Nowell, P. C.; Croce, C. M.; Canaani, E. : Genes on chromosomes 4, 9, and 19 involved in 11q23 abnormalities in acute leukemia share sequence homology and/or common motifs. Proc. Nat. Acad. Sci. 90: 4631–4635, 1993. ; and
- [7915] Strissel, P. L.; Strick, R.; Tomek, R. J.; Roe, B. A.; Rowley, J. D.; Zeleznik–Le, N. J. : DNA structural properties of AF9 are similar to MLL and could act as recombination hot spots r.
- [7916] Further studies establishing the function and utilities of MLLT3 are found in John Hopkins OMIM database record ID 159558, and in cited publications numbered 3277 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430) is another VGAM67 host target gene. MN1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MN1, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MN1 BINDING SITE, designated SEQ ID:8271, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7917] Another function of VGAM67 is therefore inhibition of Meningioma (disrupted in balanced translocation) 1 (MN1, Accession NM_002430). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MN1. A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274) is another VGAM67 host target gene. AKAP6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKAP6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKAP6 BINDING SITE, designated SEQ ID:10492, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7918] Another function of VGAM67 is therefore inhibition of A Kinase (PRKA) Anchor Protein 6 (AKAP6, Accession NM_004274). Accordingly, utilities of VGAM67 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with AKAP6. DJ37E16.5 (Accession NM_020315) is another VGAM67 host target gene.

DJ37E16.5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DJ37E16.5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DJ37E16.5 BINDING SITE, designated SEQ ID:21579, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7919] Another function of VGAM67 is therefore inhibition of DJ37E16.5 (Accession NM_020315). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DJ37E16.5. FLJ20694 (Accession NM_017928) is another VGAM67 host target gene. FLJ20694 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ20694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20694 BINDING

SITE, designated SEQ ID:19603, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7920] Another function of VGAM67 is therefore inhibition of FLJ20694 (Accession NM_017928). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20694. KIAA0276 (Accession XM_048199) is another VGAM67 host target gene. KIAA0276 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0276, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0276 BINDING SITE, designated SEQ ID:35138, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7921] Another function of VGAM67 is therefore inhibition of KIAA0276 (Accession XM_048199). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0276. KIAA0993 (Accession XM_034413) is another VGAM67 host target gene. KIAA0993 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0993, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0993 BINDING SITE, designated SEQ ID:32082, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7922] Another function of VGAM67 is therefore inhibition of KIAA0993 (Accession XM_034413). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0993. KIAA1056 (Accession NM_014894) is another VGAM67 host target gene. KIAA1056 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1056, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1056 BINDING SITE, designated SEQ ID:17045, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7923] Another function of VGAM67 is therefore inhibition of

KIAA1056 (Accession NM_014894). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1056. LOC257354 (Accession XM_170810) is another VGAM67 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45573, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7924] Another function of VGAM67 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC90198 (Accession XM_029882) is another VGAM67 host target gene. LOC90198 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90198, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC90198 BINDING SITE, designated SEQ ID:30957, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7925] Another function of VGAM67 is therefore inhibition of LOC90198 (Accession XM_029882). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90198. LOC91380 (Accession XM_038134) is another VGAM67 host target gene. LOC91380 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC91380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91380 BINDING SITE, designated SEQ ID:32761, to the nucleotide sequence of VGAM67 RNA, herein designated VGAM RNA, also designated SEQ ID:2778.

[7926] Another function of VGAM67 is therefore inhibition of LOC91380 (Accession XM_038134). Accordingly, utilities of VGAM67 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91380. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 68 (VGAM68) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7927] VGAM68 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM68 was detected is described hereinabove with reference to Figs. 1–8.

[7928] VGAM68 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7929] VGAM68 gene encodes a VGAM68 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM68 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM68 precursor RNA is designated SEQ ID:54, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:54 is

located at position 27881 relative to the genome of Invertebrate Iridescent Virus 6.

[7930] VGAM68 precursor RNA folds onto itself, forming VGAM68 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7931] An enzyme complex designated DICER COMPLEX, `dices` the VGAM68 folded precursor RNA into VGAM68 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM68 RNA is designated SEQ ID:2779, and is provided hereinbelow with reference to the sequence listing part.

[7932] VGAM68 host target gene, herein designated VGAM HOST

TARGET GENE, encodes a corresponding messenger RNA, VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM68 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7933] VGAM68 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM68 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM68 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM68 host target RNA, herein designated VGAM

HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7934] The complementary binding of VGAM68 RNA, herein designated VGAM RNA, to host target binding sites on VGAM68 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM68 host target RNA into VGAM68 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7935] It is appreciated that VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM68 host target genes. The mRNA of each one of this plurality of VGAM68 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM68 RNA, herein designated VGAM RNA, and which when bound by VGAM68 RNA causes inhibition of translation of respective one or more VGAM68 host target proteins.

[7936] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM68 gene, herein designated VGAM GENE, on one or more VGAM68 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7937] It is yet further appreciated that a function of VGAM68 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM68 correlate with, and may be deduced from, the identity of

the host target genes which VGAM68 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7938] Nucleotide sequences of the VGAM68 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM68 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM68 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM68 are further described hereinbelow with reference to Table 1.

[7939] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM68 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM68 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7940] As mentioned hereinabove with reference to Fig. 1, a function of VGAM68 gene, herein designated VGAM is inhibition of expression of VGAM68 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM68 correlate with, and may be deduced from, the identity of the target genes which VGAM68 binds and in-

hibits, and the function of these target genes, as elaborated hereinbelow.

[7941] Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM_001609) is a VGAM68 host target gene. ACADSB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACADSB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACADSB BINDING SITE, designated SEQ ID:7314, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7942] A function of VGAM68 is therefore inhibition of Acyl-Coenzyme A Dehydrogenase, Short/branched Chain (ACADSB, Accession NM_001609). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACADSB. Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529) is another VGAM68 host target gene. MLLT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MLLT3,

corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MLLT3 BINDING SITE, designated SEQ ID:10870, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7943] Another function of VGAM68 is therefore inhibition of Myeloid/lymphoid Or Mixed-lineage Leukemia (trithorax homolog, Drosophila); Translocated To, 3 (MLLT3, Accession NM_004529), a gene which is Serine and proline rich protein. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MLLT3. The function of MLLT3 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM67. Methylthioadenosine Phosphorylase (MTAP, Accession NM_002451) is another VGAM68 host target gene. MTAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MTAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of MTAP BINDING SITE, designated SEQ ID:8287, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7944] Another function of VGAM68 is therefore inhibition of Methylthioadenosine Phosphorylase (MTAP, Accession NM_002451), a gene which plays a major role in polyamine metabolism. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MTAP. The function of MTAP has been established by previous studies. Methylthioadenosine phosphorylase (EC 24.2.28) plays a major role in polyamine metabolism and is important for the salvage of both adenine and methionine. For example, as much as 97% of the endogenous adenine produced by human lymphoblasts in culture is formed by catabolism of methylthioadenosine (OMIM Ref. No. MeSAdo) by the phosphorylase. MeSAdo, a by-product of the synthesis of the polyamines spermidine and spermine, potently inhibits polyamine aminopropyltransferase reactions if not removed by the above phosphorylase reaction. MeSAdo phosphorylase is abundant in normal cells and tissues but lacking from many human and murine malignant cell lines

and from some human leukemias in vivo. Carrera et al. (1984) studied hybrids between MeSAdo phosphorylase-deficient mouse L cells and human fibroblasts to show that the structural gene (symbolized MSAP or MTAP) is located in the 9pter-q12 segment. This enzyme is missing in malignant cells in cases of lymphomatous acute lymphoblastic leukemia (OMIM Ref. No. 247640); many of these cases have abnormality of 9p22-p21 (Chilcote et al., 1985). As indicated by the findings of Olopade et al. (1992), the MTAP locus is centromeric to the cluster of interferon genes (e.g., 147640). Thus, the likely location of MTAP is 9p21. Nobori et al. (1996) cloned the MTAP gene and constructed a topologic map of the 9p21 region using YAC clones, pulsed-field gel electrophoresis, and sequence tagged-site PCR. The MTAP gene consists of 8 exons and 7 introns. Of 23 malignant cell lines deficient in MTAP protein, all but 1 had complete or partial deletions. Partial or total deletions of the MTAP gene were found in primary T-cell acute lymphoblastic leukemias. Within intron 4 they found a deletion breakpoint of partial deletions present in malignant cell lines and primary T-cell acute lymphoblastic leukemias. Starting from the centromeric end, the gene order on chromosome 9p21 was

found to be p15 (OMIM Ref. No. 600431)--p16--MTAP--IFNA (OMIM Ref. No. 147660)--IFNB. These results indicated to Nobori et al. (1996) that MTAP deficiency in cancer is primarily due to codeletion of the MTAP and p16 genes.

- [7945] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [7946] Carrera, C. J.; Eddy, R. L.; Shows, T. B.; Carson, D. A. : Assignment of the gene for methylthioadenosine phosphorylase to human chromosome 9 by mouse-human somatic cell hybridization. Proc. Nat. Acad. Sci. 81: 2665-2668, 1984. ; and
- [7947] Nobori, T.; Takabayashi, K.; Tran, P.; Orvis, L.; Batova, A.; Yu, A. L.; Carson, D. A. : Genomic cloning of methylthioadenosine phosphorylase: a purine metabolic enzyme deficient in mult.
- [7948] Further studies establishing the function and utilities of MTAP are found in John Hopkins OMIM database record ID 156540, and in cited publications numbered 12712-12718 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tryptophanyl-tRNA Synthetase (WARS, Accession

XM_041014) is another VGAM68 host target gene. WARS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WARS BINDING SITE, designated SEQ ID:33413, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7949] Another function of VGAM68 is therefore inhibition of Tryptophanyl-tRNA Synthetase (WARS, Accession XM_041014), a gene which is a tryptophanyl-tRNA synthetase. Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WARS. The function of WARS has been established by previous studies. Otani et al. (2002) showed that a recombinant form of a COOH-terminal fragment of tryptophanyl-tRNA synthetase is a potent antagonist of vascular endothelial growth factor (VEGF; 192240)-induced angiogenesis in a mouse model and of naturally occurring retinal angiogenesis in the neonatal mouse. Angiostatic activity was dose-dependent in both systems. The full-length protein was inactive as an antag-

onist of angiogenesis. The results suggested that fragments of tryptophanyl-tRNA synthetase, as naturally occurring and potentially nonimmunogenic anti-angiogenics, can be used for the treatment of neovascular eye diseases. In normal cells, human tryptophanyl-tRNA synthetase exists in 2 forms. The major form is the full-length protein, and the other is a truncated form in which most of the extra-NH₂-terminal domain is deleted because of alternative splicing of the pre-mRNA (Tolstrup et al., 1995; Turpaev et al., 1996), with met48 being deduced as the NH₂-terminal residue of the truncated form. The expression of the short form of WARS is highly stimulated in human cells by the addition of interferon-gamma (IFNG; 147570).

[7950] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Narovlyansky, A. N.; Amchenkova, A. M.; Justesen, J.; Frolova, L. Y. : Alternative processing of the tryptophanyl-tRNA synthetase mRNA f.

[7953] Further studies establishing the function and utilities of WARS are found in John Hopkins OMIM database record ID 191050, and in cited publications numbered 10493-10495, 974 and 9765-9771 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Di-Ras2 (Accession NM_017594) is another VGAM68 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ ID:19046, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7954] Another function of VGAM68 is therefore inhibition of Di-Ras2 (Accession NM_017594). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. RAB39, Member RAS Oncogene Family (RAB39, Accession

XM_084662) is another VGAM68 host target gene. RAB39 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB39, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB39 BINDING SITE, designated SEQ ID:37646, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7955] Another function of VGAM68 is therefore inhibition of RAB39, Member RAS Oncogene Family (RAB39, Accession XM_084662). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB39. LOC158292 (Accession XM_098914) is another VGAM68 host target gene. LOC158292 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158292 BINDING SITE, designated SEQ ID:41931, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2779.

[7956] Another function of VGAM68 is therefore inhibition of LOC158292 (Accession XM_098914). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158292. LOC93380 (Accession XM_051020) is another VGAM68 host target gene. LOC93380 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC93380, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC93380 BINDING SITE, designated SEQ ID:35727, to the nucleotide sequence of VGAM68 RNA, herein designated VGAM RNA, also designated SEQ ID:2779.

[7957] Another function of VGAM68 is therefore inhibition of LOC93380 (Accession XM_051020). Accordingly, utilities of VGAM68 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC93380. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 69 (VGAM69) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7958] VGAM69 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM69 was detected is described hereinabove with reference to Figs. 1–8.

[7959] VGAM69 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7960] VGAM69 gene encodes a VGAM69 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM69 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM69 precursor RNA is designated SEQ ID:55, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:55 is located at position 108748 relative to the genome of Invertebrate Iridescent Virus 6.

[7961] VGAM69 precursor RNA folds onto itself, forming VGAM69

folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7962] An enzyme complex designated DICER COMPLEX, `dices` the VGAM69 folded precursor RNA into VGAM69 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM69 RNA is designated SEQ ID:2780, and is provided hereinbelow with reference to the sequence listing part.

[7963] VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM69 host target RNA comprises three

regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[7964] VGAM69 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM69 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM69 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target bind-

ing sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[7965] The complementary binding of VGAM69 RNA, herein designated VGAM RNA, to host target binding sites on VGAM69 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM69 host target RNA into VGAM69 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7966] It is appreciated that VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM69 host target genes. The mRNA of each one of this plurality of VGAM69 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM69 RNA, herein designated VGAM RNA, and which when bound by VGAM69 RNA causes inhibition of translation of respective one or more VGAM69 host target proteins.

[7967] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM69 gene, herein designated VGAM GENE, on one or more VGAM69 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7968] It is yet further appreciated that a function of VGAM69 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM69 correlate with, and may be deduced from, the identity of the host target genes which VGAM69 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7969] Nucleotide sequences of the VGAM69 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM69 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM69 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM69 are further described hereinbelow with reference to Table 1.

[7970] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM69 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM69 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7971] As mentioned hereinabove with reference to Fig. 1, a function of VGAM69 gene, herein designated VGAM is inhibition of expression of VGAM69 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM69 correlate with, and may be deduced from, the identity of the target genes which VGAM69 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7972] DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*)

(DCLRE1A, Accession XM_044815) is a VGAM69 host target gene. DCLRE1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by DCLRE1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DCLRE1A BINDING SITE, designated SEQ ID:34280, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:2780.

[7973] A function of VGAM69 is therefore inhibition of DNA Cross-link Repair 1A (PSO2 homolog, *S. cerevisiae*) (DCLRE1A, Accession XM_044815). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DCLRE1A. Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM_045261) is another VGAM69 host target gene. LRRN3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LRRN3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LRRN3 BINDING SITE, designated SEQ

ID:34398, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:2780.

[7974] Another function of VGAM69 is therefore inhibition of Leucine-rich Repeat Protein, Neuronal 3 (LRRN3, Accession XM_045261). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LRRN3. Phosphatidylserine Decarboxylase (PISD, Accession NM_014338) is another VGAM69 host target gene. PISD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PISD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PISD BINDING SITE, designated SEQ ID:15652, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:2780.

[7975] Another function of VGAM69 is therefore inhibition of Phosphatidylserine Decarboxylase (PISD, Accession NM_014338). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PISD. RGPR (Accession

NM_033127) is another VGAM69 host target gene. RGPR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGPR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGPR BINDING SITE, designated SEQ ID:26970, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ ID:2780.

[7976] Another function of VGAM69 is therefore inhibition of RGPR (Accession NM_033127). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGPR. Solute Carrier Family 38, Member 1 (SLC38A1, Accession NM_030674) is another VGAM69 host target gene. SLC38A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC38A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC38A1 BINDING SITE, designated SEQ ID:25036, to the nucleotide sequence of VGAM69 RNA, herein designated VGAM RNA, also designated SEQ

ID:2780.

[7977] Another function of VGAM69 is therefore inhibition of Solute Carrier Family 38, Member 1 (SLC38A1, Accession NM_030674). Accordingly, utilities of VGAM69 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC38A1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 70 (VGAM70) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[7978] VGAM70 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM70 was detected is described hereinabove with reference to Figs. 1–8.

[7979] VGAM70 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[7980] VGAM70 gene encodes a VGAM70 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM70 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM70 precursor RNA is designated SEQ ID:56, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:56 is located at position 20882 relative to the genome of Invertebrate Iridescent Virus 6.

[7981] VGAM70 precursor RNA folds onto itself, forming VGAM70 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[7982] An enzyme complex designated DICER COMPLEX, `dices` the VGAM70 folded precursor RNA into VGAM70 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 71%) nucleotide sequence of VGAM70 RNA is designated SEQ ID:2781, and is provided hereinbelow with reference to the sequence listing part.

[7983] VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM70 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[7984] VGAM70 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM70 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM70 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[7985] The complementary binding of VGAM70 RNA, herein designated VGAM RNA, to host target binding sites on VGAM70 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM70 host target RNA into VGAM70 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[7986] It is appreciated that VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM70 host target genes. The mRNA of each one of this plurality of VGAM70 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM70 RNA, herein designated VGAM RNA, and which when bound by VGAM70 RNA causes inhibition of translation of respective one or more VGAM70 host target proteins.

[7987] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM70 gene, herein designated VGAM GENE, on one or more VGAM70 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[7988] It is yet further appreciated that a function of VGAM70 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM70 correlate with, and may be deduced from, the identity of the host target genes which VGAM70 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[7989] Nucleotide sequences of the VGAM70 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM70 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM70 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM70 are further described hereinbelow with reference to Table 1.

[7990] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM70 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM70 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[7991] As mentioned hereinabove with reference to Fig. 1, a function of VGAM70 gene, herein designated VGAM is inhibition of expression of VGAM70 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM70 correlate with, and may be deduced from, the identity of the target genes which VGAM70 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[7992] Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337) is a VGAM70 host target gene. C8orf1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf1 BINDING SITE, designated SEQ ID:10532, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:2781.

[7993] A function of VGAM70 is therefore inhibition of Chromosome 8 Open Reading Frame 1 (C8orf1, Accession NM_004337). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf1. Carnitine O-

octanoyltransferase (CROT, Accession NM_021151) is another VGAM70 host target gene. CROT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CROT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CROT BINDING SITE, designated SEQ ID:22126, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:2781.

[7994] Another function of VGAM70 is therefore inhibition of Carnitine O-octanoyltransferase (CROT, Accession NM_021151), a gene which CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid. Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CROT. The function of CROT has been established by previous studies. Carnitine octanoyltransferase (EC 2.3.1.137) is a carnitine acyltransferase that catalyzes the reversible transfer of fatty acyl groups between CoA and carnitine. This provides a crucial step in the transport of medium- and long-chain acyl-CoA out of the mammalian peroxisome to the cytosol and

mitochondria. See also CRAT (OMIM Ref. No. 600184). Van der Leij et al. (2000) reviewed the function, structural features, and phylogenetics of human carnitine acyltransferase genes, including CROT Using enzyme activity measurements of CROT expressed in a carnitine acetyltransferase-deficient yeast strain, Ferdinandusse et al. (1999) demonstrated that CROT efficiently converts a branched-chain fatty acyl-CoA (4,8-dimethylnonanoyl-CoA) to its corresponding carnitine ester. They hypothesized that CROT plays a crucial role in the beta-oxidation of branched-chain fatty acids including pristanic acid

[7995] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[7996] Ferdinandusse, S.; Mulders, J.; IJlst, L.; Denis, S.; Dacremont, G.; Waterham, H. R.; Wanders, R. J. A. : Molecular cloning and expression of human carnitine octanoyltransferase: evidence for its role in the peroxisomal beta-oxidation of branched-chain fatty acids. *Biochem. Biophys. Res. Commun.* 263: 213-218, 1999. ; and

139–153, 2000.

[7998] Further studies establishing the function and utilities of CROT are found in John Hopkins OMIM database record ID 606090, and in cited publications numbered 612 and 7746 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PB1 (Accession NM_018165) is another VGAM70 host target gene. PB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PB1 BINDING SITE, designated SEQ ID:19984, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:2781.

[7999] Another function of VGAM70 is therefore inhibition of PB1 (Accession NM_018165). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PB1. Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007) is another VGAM70 host target gene. PLAGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL2, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL2 BINDING SITE, designated SEQ ID:34882, to the nucleotide sequence of VGAM70 RNA, herein designated VGAM RNA, also designated SEQ ID:2781.

[8000] Another function of VGAM70 is therefore inhibition of Pleiomorphic Adenoma Gene-like 2 (PLAGL2, Accession XM_047007). Accordingly, utilities of VGAM70 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 71 (VGAM71) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8001] VGAM71 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM71 was detected is described hereinabove with reference to Figs. 1-8.

[8002] VGAM71 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent

Virus 6. VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8003] VGAM71 gene encodes a VGAM71 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM71 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM71 precursor RNA is designated SEQ ID:57, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:57 is located at position 34908 relative to the genome of Invertebrate Iridescent Virus 6.

[8004] VGAM71 precursor RNA folds onto itself, forming VGAM71 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8005] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM71 folded precursor RNA into VGAM71 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM71 RNA is designated SEQ ID:2782, and is provided hereinbelow with reference to the sequence listing part.

[8006] VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM71 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8007] VGAM71 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide

sequence of VGAM71 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM71 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8008] The complementary binding of VGAM71 RNA, herein designated VGAM RNA, to host target binding sites on VGAM71 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM71 host target RNA into VGAM71 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target

protein is therefore outlined by a broken line.

[8009] It is appreciated that VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM71 host target genes. The mRNA of each one of this plurality of VGAM71 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM71 RNA, herein designated VGAM RNA, and which when bound by VGAM71 RNA causes inhibition of translation of respective one or more VGAM71 host target proteins.

[8010] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM71 gene, herein designated VGAM GENE, on one or more VGAM71 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression

of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8011] It is yet further appreciated that a function of VGAM71 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM71 correlate with, and may be deduced from, the identity of the host target genes which VGAM71 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8012] Nucleotide sequences of the VGAM71 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM71 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM71 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM71 are further described hereinbelow with reference to Table 1.

[8013] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM71 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM71 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8014] As mentioned hereinabove with reference to Fig. 1, a function of VGAM71 gene, herein designated VGAM is inhibition of expression of VGAM71 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM71 correlate with, and may be deduced from, the identity of the target genes which VGAM71 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8015] Cardiotrophin 1 (CTF1, Accession NM_001330) is a VGAM71 host target gene. CTF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CTF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CTF1 BINDING SITE, designated SEQ ID:7012, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8016] A function of VGAM71 is therefore inhibition of Cardiotrophin 1 (CTF1, Accession NM_001330), a gene which may play a role in cardiac hypertrophy. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CTF1. The function of CTF1 has been established by previous studies. Heart failure is a leading cause of mortality worldwide. A hallmark of the disease is dilated cardiac hypertrophy, which is accompanied by a reactivation of genes expressed in fetal heart development. Reasoning that fetal or embryonic growth factors may mediate the onset of cardiac hypertrophy, Pennica et al. (1995) coupled expression cloning with an embryonic stem cell-based model of cardiogenesis to isolate a 21.5-kD protein, cardiotrophin 1, that potently induces cardiac myocyte hypertrophy in vitro. Amino acid similarity data indicated that CT1 is a member of the family of cytokines that includes leukemia inhibitory factor (LIF; 159540), ciliary neurotrophic factor (CNTF; 118945), oncostatin M (OSM; 165095), interleukin 6 (IL6; 147620), and interleukin 11 (IL11; 147681). Several members of this family that are known to signal through the transmembrane protein gp130 (OMIM Ref. No. 162820) stimulate cardiac my-

ocyte hypertrophy, like cardiotrophin 1, suggesting that the gp130 signaling pathway may play a role in cardiac hypertrophy. The 1.4-kb CT1 mRNA is present in the heart and several other mouse tissues. Amyotrophic lateral sclerosis (ALS; 105400) is mainly a sporadic neurodegenerative disorder characterized by loss of cortical and spinal motoneurons. Some familial ALS (FALS) cases have been linked to dominant mutations in the gene encoding Cu/Zn superoxide dismutase (SOD1; 147450). Transgenic mice overexpressing a mutated form of human SOD1 with a gly93-to-ala substitution (147450.0008) develop progressive muscle wasting and paralysis as a result of spinal motoneuron loss and die at 5 to 6 months. Bordet et al. (2001) investigated the effects of neurotrophic factor gene delivery in this FALS model. Intramuscular injection of an adenoviral vector encoding CTF1 in SOD1(G93A) newborn mice delayed the onset of motor impairment as assessed in the rotarod test. By CTF1 treatment, axonal degeneration was slowed, skeletal muscle atrophy was largely reduced, and the time-course of motor impairment was significantly decreased.

[8017] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

I. : Expression cloning of cardiotrophin 1, a cytokine that induces cardiac myocyte hypertrophy. *Proc. Nat. Acad. Sci.* 92: 1142–1146, 1995. ; and
- [8019] Bordet, T.; Lesbordes, J.-C.; Rouhani, S.; Castelnau-Ptakhine, L.; Schmalbruch, H.; Haase, G.; Kahn, A. : Protective effects of cardiotrophin-1 adenoviral gene transfer on neuromuscular.
- [8020] Further studies establishing the function and utilities of CTF1 are found in John Hopkins OMIM database record ID 600435, and in cited publications numbered 12309–776 and 7677 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. NEBL (Accession NM_006393) is another VGAM71 host target gene. NEBL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NEBL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NEBL BINDING SITE, designated SEQ ID:13102,

to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8021] Another function of VGAM71 is therefore inhibition of NEBL (Accession NM_006393). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NEBL. Opioid Binding Protein/cell Adhesion Molecule-like (OPCML, Accession NM_002545) is another VGAM71 host target gene. OPCML BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPCML, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPCML BINDING SITE, designated SEQ ID:8397, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8022] Another function of VGAM71 is therefore inhibition of Opioid Binding Protein/cell Adhesion Molecule-like (OPCML, Accession NM_002545), a gene which may function as a GPI-anchored neural cell adhesion molecule. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with OPCML. The function of OPCML has been established by previous studies. OBCAM, also designated OPCML, is a protein that binds opioid alkaloids in the presence of acidic lipids, exhibiting selectivity for mu ligands. It shares structural homology with members of the immunoglobulin protein superfamily, most notably with cell-adhesion molecules. Analysis of the amino acid sequence indicates that it is an extracellularly located molecule, and the presence of a hydrophobic C terminus suggests that it may be inserted into the cell membrane through phosphatidylinositol linkage. Shark and Lee (1995) stated that, due to the lack of transmembrane domains necessary for signal transduction, it is improbable that OBCAM acts independently as an opioid receptor; more likely, it plays an important accessory role in opioid receptor function. OBCAM was first purified from bovine brain by Cho et al. (1986). The gene was mapped to mouse chromosome 9, and from linkage homology data it was predicted that its human counterpart would lie on either 19p or 11q22-qter (Chakraborti et al., 1993). Shark and Lee (1995) used DNA primers derived from rat OBCAM cDNA to PCR-amplify a 403-bp fragment from a human brain cDNA library. The fragment was cloned, se-

quenced, and used as a hybridization probe to screen the library to obtain a cDNA fragment, including a complete open reading frame of 1,038 bp. Sequence analysis of the ORF revealed 93% identity to the rat OBCAM cDNA at the nucleotide level and 98% identity at the deduced amino acid sequence level. By hybridization to a somatic cell hybrid panel, they mapped the gene to chromosome 11. They noted that the gene for neural cell adhesion molecule (NCAM; 116930) and other proteins of similar structure that are expressed in the nervous system also map to 11q22–q23.

[8023] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8024] Chakraborti, A.; Lippman, D. L.; Loh, H. H.; Kozak, C. A.; Lee, N. M. : Genetic mapping of opioid binding protein gene(s) to mouse chromosome 9. *Mammalian Genome* 4: 179–182, 1993. ; and

[8025] Shark, K. B.; Lee, N. M. : Cloning, sequencing and localization to chromosome 11 of a cDNA encoding a human opioid-binding cell adhesion molecule (OBCAM). *Gene* 155: 213–217, 1995.

[8026] Further studies establishing the function and utilities of

OPCML are found in John Hopkins OMIM database record ID 600632, and in cited publications numbered 6836–6838 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protocadherin Alpha 9 (PCDHA9, Accession NM_014005) is another VGAM71 host target gene. PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PCDHA9, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHA9 BINDING SITE1 and PCDHA9 BINDING SITE2, designated SEQ ID:15215 and SEQ ID:25607 respectively, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8027] Another function of VGAM71 is therefore inhibition of Protocadherin Alpha 9 (PCDHA9, Accession NM_014005), a gene which is a calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHA9. The function of PCDHA9 has been established by previous studies. Cadherins are

calcium-dependent cell-cell adhesion molecules that mediate neural cell-cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHA9 is a member of the alpha cluster of protocadherin genes on 5q31. By screening a brain cDNA library for sequences with the potential to encode large proteins, Nagase et al. (1997) identified a cDNA encoding PCDHA9, which they termed KIAA0345. The deduced protein has 842 amino acids. RT-PCR analysis detected strongest expression of KIAA0345 in kidney and testis, followed by brain, lung, pancreas, and ovary.

[8028] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8029] Nagase, T.; Ishikawa, I.; Nakajima, D.; Ohira, M.; Seki, N.; Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; O'Hara, O. : Prediction of the coding sequences of unidentified human genes. VII. The complete sequences of 100 new cDNA clones from brain which can code for large proteins in vitro. DNA Res. 4: 141-150, 1997. ; and

[8030] Wu, Q.; Zhang, T.; Cheng, J.-F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; Myers, R. M.; Maniatis, T. : Comparative DNA sequence anal-

ysis of mouse and.

[8031] Further studies establishing the function and utilities of PCDHA9 are found in John Hopkins OMIM database record ID 606315, and in cited publications numbered 730 and 9535 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB4A, Member RAS Oncogene Family (RAB4A, Accession NM_004578) is another VGAM71 host target gene. RAB4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB4A BINDING SITE, designated SEQ ID:10926, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8032] Another function of VGAM71 is therefore inhibition of RAB4A, Member RAS Oncogene Family (RAB4A, Accession NM_004578), a gene which is involved in protein transport. Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB4A. The function of RAB4A has been established by previous studies. The mammalian

RAB proteins show striking similarities to the *S. cerevisiae* YPT1 and SEC4 proteins, Ras-related GTP-binding proteins involved in the regulation of secretion. Zahraoui et al. (1989) isolated cDNAs encoding RAB4 and several other human RAB proteins. See RAB5A (OMIM Ref. No. 179512). The predicted 213-amino acid human RAB4 protein shares 98% and 50% identity with rat Rab4 and human RAB2, respectively. Northern blot analysis revealed that the RAB4 gene was expressed weakly as 1.8-, 3.1-, and 3.6-kb mRNAs in a human fibroblast cell line. By in situ hybridization, Rousseau-Merck et al. (1991) assigned the RAB4 gene to 1q42-q43. Barbosa et al. (1995) referred to this locus as RAV4A and mapped the mouse homolog by interspecific backcross analysis to the distal end of mouse chromosome 8. The authors mapped Rab4b to proximal mouse chromosome 7. They also reported that 4 additional members of the mouse Rab gene family exist on mouse chromosomes 2, 9, 12, and 13.

[8033] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8034] Barbosa, M. D. F. S.; Johnson, S. A.; Achey, K.; Gutierrez, M.; Wakeland, E. K.; Zerial, M.; Kingsmore, S. F. : The Rab

protein family: genetic mapping of six Rab genes in the mouse. Genomics 30: 439–444, 1995. ; and

[8035] Zahraoui, A.; Touchot, N.; Chardin, P.; Tavitian, A. : The human rab genes encode a family of GTP-binding proteins related to yeast YPT1 and SEC4 products involved in secretion. J. Biol.

[8036] Further studies establishing the function and utilities of RAB4A are found in John Hopkins OMIM database record ID 179511, and in cited publications numbered 2540–254 and 2722 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ADP-ribosylation Factor GTPase Activating Protein 3 (ARFGAP3, Accession NM_014570) is another VGAM71 host target gene. ARFGAP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARFGAP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARFGAP3 BINDING SITE, designated SEQ ID:15926, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8037] Another function of VGAM71 is therefore inhibition of

ADP-ribosylation Factor GTPase Activating Protein 3 (ARFGAP3, Accession NM_014570). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARF-GAP3. BOP (Accession XM_097915) is another VGAM71 host target gene. BOP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BOP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BOP BINDING SITE, designated SEQ ID:41211, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8038] Another function of VGAM71 is therefore inhibition of BOP (Accession XM_097915). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BOP. Chemokine (C-C motif) Receptor 1 (CCR1, Accession NM_001295) is another VGAM71 host target gene. CCR1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CCR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCR1 BINDING SITE, designated SEQ ID:6976, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8039] Another function of VGAM71 is therefore inhibition of Chemokine (C-C motif) Receptor 1 (CCR1, Accession NM_001295). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCR1. DKFZP434F1735 (Accession NM_015590) is another VGAM71 host target gene. DKFZP434F1735 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZP434F1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434F1735 BINDING SITE, designated SEQ ID:17856, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8040] Another function of VGAM71 is therefore inhibition of DKFZP434F1735 (Accession NM_015590). Accordingly, utilities of VGAM71 include diagnosis, prevention and treat-

ment of diseases and clinical conditions associated with DKFZP434F1735. DKFZP434P211 (Accession NM_014549) is another VGAM71 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15871, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8041] Another function of VGAM71 is therefore inhibition of DKFZP434P211 (Accession NM_014549). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. EKI1 (Accession NM_018638) is another VGAM71 host target gene. EKI1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by EKI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EKI1 BINDING SITE, desig-

nated SEQ ID:20709, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8042] Another function of VGAM71 is therefore inhibition of EKI1 (Accession NM_018638). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EKI1. Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962) is another VGAM71 host target gene. KCNT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNT1 BINDING SITE, designated SEQ ID:30979, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8043] Another function of VGAM71 is therefore inhibition of Potassium Channel, Subfamily T, Member 1 (KCNT1, Accession XM_029962). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNT1. KIAA1046

(Accession NM_014928) is another VGAM71 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1046 BINDING SITE, designated SEQ ID:17222, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8044] Another function of VGAM71 is therefore inhibition of KIAA1046 (Accession NM_014928). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. KIAA1719 (Accession XM_042936) is another VGAM71 host target gene. KIAA1719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1719 BINDING SITE, designated SEQ ID:33826, to the nucleotide sequence of VGAM71 RNA, herein designated

VGAM RNA, also designated SEQ ID:2782.

[8045] Another function of VGAM71 is therefore inhibition of KIAA1719 (Accession XM_042936). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1719. MGC20253 (Accession NM_144583) is another VGAM71 host target gene. MGC20253 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20253, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20253 BINDING SITE, designated SEQ ID:29400, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8046] Another function of VGAM71 is therefore inhibition of MGC20253 (Accession NM_144583). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20253. MGC5566 (Accession NM_024049) is another VGAM71 host target gene. MGC5566 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5566, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5566 BINDING SITE, designated SEQ ID:23487, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8047] Another function of VGAM71 is therefore inhibition of MGC5566 (Accession NM_024049). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC5566. SDF1 (Accession XM_165565) is another VGAM71 host target gene. SDF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDF1 BINDING SITE, designated SEQ ID:43692, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8048] Another function of VGAM71 is therefore inhibition of SDF1 (Accession XM_165565). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SDF1.

Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131) is another VGAM71 host target gene. SRF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SRF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SRF BINDING SITE, designated SEQ ID:9106, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8049] Another function of VGAM71 is therefore inhibition of Serum Response Factor (c-fos serum response element-binding transcription factor) (SRF, Accession NM_003131). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SRF. Tripartite Motif-containing 26 (TRIM26, Accession NM_003449) is another VGAM71 host target gene. TRIM26 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRIM26, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BIND-

ING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM26 BINDING SITE, designated SEQ ID:9502, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8050] Another function of VGAM71 is therefore inhibition of Tripartite Motif-containing 26 (TRIM26, Accession NM_003449). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM26. LOC114971 (Accession XM_054936) is another VGAM71 host target gene. LOC114971 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC114971, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114971 BINDING SITE, designated SEQ ID:36211, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8051] Another function of VGAM71 is therefore inhibition of LOC114971 (Accession XM_054936). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC114971. LOC148189 (Accession XM_086087) is another VGAM71 host target gene. LOC148189 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148189 BINDING SITE, designated SEQ ID:38488, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8052] Another function of VGAM71 is therefore inhibition of LOC148189 (Accession XM_086087). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148189. LOC151121 (Accession XM_087102) is another VGAM71 host target gene. LOC151121 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151121 BINDING SITE, designated SEQ ID:39054, to

the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8053] Another function of VGAM71 is therefore inhibition of LOC151121 (Accession XM_087102). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151121. LOC151473 (Accession XM_087215) is another VGAM71 host target gene. LOC151473 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC151473, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151473 BINDING SITE, designated SEQ ID:39124, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8054] Another function of VGAM71 is therefore inhibition of LOC151473 (Accession XM_087215). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151473. LOC200734 (Accession XM_114286) is another VGAM71 host target gene. LOC200734 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC200734, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200734 BINDING SITE, designated SEQ ID:42845, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8055] Another function of VGAM71 is therefore inhibition of LOC200734 (Accession XM_114286). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200734. LOC221943 (Accession XM_168343) is another VGAM71 host target gene. LOC221943 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221943, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221943 BINDING SITE, designated SEQ ID:45117, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8056] Another function of VGAM71 is therefore inhibition of LOC221943 (Accession XM_168343). Accordingly, utilities

of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221943. LOC257494 (Accession XM_175212) is another VGAM71 host target gene. LOC257494 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257494 BINDING SITE, designated SEQ ID:46689, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8057] Another function of VGAM71 is therefore inhibition of LOC257494 (Accession XM_175212). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257494. LOC91522 (Accession XM_038953) is another VGAM71 host target gene. LOC91522 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91522, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91522 BINDING SITE, designated SEQ ID:32963, to the nucleotide sequence of VGAM71 RNA, herein designated VGAM RNA, also designated SEQ ID:2782.

[8058] Another function of VGAM71 is therefore inhibition of LOC91522 (Accession XM_038953). Accordingly, utilities of VGAM71 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91522. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 72 (VGAM72) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8059] VGAM72 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM72 was detected is described hereinabove with reference to Figs. 1–8.

[8060] VGAM72 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8061] VGAM72 gene encodes a VGAM72 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM72 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM72 precursor RNA is designated SEQ ID:58, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:58 is located at position 19212 relative to the genome of Invertebrate Iridescent Virus 6.

[8062] VGAM72 precursor RNA folds onto itself, forming VGAM72 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8063] An enzyme complex designated DICER COMPLEX, `dices` the VGAM72 folded precursor RNA into VGAM72 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 47%) nucleotide sequence of VGAM72 RNA is designated SEQ ID:2783, and is provided hereinbelow with reference to the sequence listing part.

[8064] VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM72 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8065] VGAM72 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM72 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM72 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8066] The complementary binding of VGAM72 RNA, herein designated VGAM RNA, to host target binding sites on VGAM72 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM72 host target RNA into VGAM72 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8067] It is appreciated that VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM72 host target genes. The mRNA of each one of this plurality of VGAM72 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM72 RNA, herein designated VGAM RNA, and which when bound by VGAM72 RNA causes inhibition of translation of respective one or more VGAM72 host target proteins.

[8068] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM72 gene, herein designated VGAM GENE, on one or more VGAM72 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8069] It is yet further appreciated that a function of VGAM72 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM72 correlate with, and may be deduced from, the identity of the host target genes which VGAM72 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8070] Nucleotide sequences of the VGAM72 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM72 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM72 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM72 are further described hereinbelow with reference to Table 1.

[8071] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM72 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM72 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[8072] As mentioned hereinabove with reference to Fig. 1, a function of VGAM72 gene, herein designated VGAM is inhibition of expression of VGAM72 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM72 correlate with, and may be deduced from, the identity of the target genes which VGAM72 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8073] SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943) is a VGAM72 host target gene. SOX12 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SOX12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SOX12 BINDING SITE, designated SEQ ID:13832, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8074] A function of VGAM72 is therefore inhibition of SRY (sex determining region Y)-box 12 (SOX12, Accession NM_006943). Accordingly, utilities of VGAM72 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with SOX12. Chromosome 21 Open Reading Frame 55 (C21orf55, Accession NM_017833) is another VGAM72 host target gene. C21orf55 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C21orf55, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C21orf55 BINDING SITE, designated SEQ ID:19499, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8075] Another function of VGAM72 is therefore inhibition of Chromosome 21 Open Reading Frame 55 (C21orf55, Accession NM_017833). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C21orf55. MGC2452 (Accession NM_032644) is another VGAM72 host target gene. MGC2452 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC2452, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nu-

cleotide sequences of MGC2452 BINDING SITE, designated SEQ ID:26370, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8076] Another function of VGAM72 is therefore inhibition of MGC2452 (Accession NM_032644). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2452. Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446) is another VGAM72 host target gene. P2RXL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by P2RXL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P2RXL1 BINDING SITE, designated SEQ ID:11926, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8077] Another function of VGAM72 is therefore inhibition of Purinergic Receptor P2X-like 1, Orphan Receptor (P2RXL1, Accession NM_005446). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases

and clinical conditions associated with P2RXL1. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840) is another VGAM72 host target gene. PPP1R16B BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R16B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R16B BINDING SITE, designated SEQ ID:30764, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8078] Another function of VGAM72 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 16B (PPP1R16B, Accession XM_028840). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R16B. LOC255328 (Accession XM_172920) is another VGAM72 host target gene. LOC255328 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC255328, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of LOC255328 BINDING SITE, designated SEQ ID:46178, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8079] Another function of VGAM72 is therefore inhibition of LOC255328 (Accession XM_172920). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255328. LOC90509 (Accession XM_032209) is another VGAM72 host target gene. LOC90509 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90509, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90509 BINDING SITE, designated SEQ ID:31611, to the nucleotide sequence of VGAM72 RNA, herein designated VGAM RNA, also designated SEQ ID:2783.

[8080] Another function of VGAM72 is therefore inhibition of LOC90509 (Accession XM_032209). Accordingly, utilities of VGAM72 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90509. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 73 (VGAM73) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8081] VGAM73 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM73 was detected is described hereinabove with reference to Figs. 1–8.

[8082] VGAM73 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8083] VGAM73 gene encodes a VGAM73 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM73 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM73 precursor RNA is designated SEQ ID:59, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:59 is

located at position 155229 relative to the genome of Invertebrate Iridescent Virus 6.

[8084] VGAM73 precursor RNA folds onto itself, forming VGAM73 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8085] An enzyme complex designated DICER COMPLEX, `dices` the VGAM73 folded precursor RNA into VGAM73 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM73 RNA is designated SEQ ID:2784, and is provided hereinbelow with reference to the sequence listing part.

[8086] VGAM73 host target gene, herein designated VGAM HOST

TARGET GENE, encodes a corresponding messenger RNA, VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM73 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8087] VGAM73 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM73 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM73 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM73 host target RNA, herein designated VGAM

HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8088] The complementary binding of VGAM73 RNA, herein designated VGAM RNA, to host target binding sites on VGAM73 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM73 host target RNA into VGAM73 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8089] It is appreciated that VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM73 host target genes. The mRNA of each one of this plurality of VGAM73 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM73 RNA, herein designated VGAM RNA, and which when bound by VGAM73 RNA causes inhibition of translation of respective one or more VGAM73 host target proteins.

[8090] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM73 gene, herein designated VGAM GENE, on one or more VGAM73 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8091] It is yet further appreciated that a function of VGAM73 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM73 correlate with, and may be deduced from, the identity of

the host target genes which VGAM73 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8092] Nucleotide sequences of the VGAM73 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM73 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM73 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM73 are further described hereinbelow with reference to Table 1.

[8093] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM73 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM73 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8094] As mentioned hereinabove with reference to Fig. 1, a function of VGAM73 gene, herein designated VGAM is inhibition of expression of VGAM73 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM73 correlate with, and may be deduced from, the identity of the target genes which VGAM73 binds and in-

hibits, and the function of these target genes, as elaborated hereinbelow.

[8095] Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858) is a VGAM73 host target gene. COL19A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by COL19A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of COL19A1 BINDING SITE, designated SEQ ID:7592, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:2784.

[8096] A function of VGAM73 is therefore inhibition of Collagen, Type XIX, Alpha 1 (COL19A1, Accession NM_001858), a gene which may act as a cross-bridge between fibrils and other extracellular matrix molecules. Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with COL19A1. The function of COL19A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM19. Dynein, Cytoplasmic, Interme-

diate Polypeptide 1 (DNCl1, Accession XM_165838) is another VGAM73 host target gene. DNCl1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNCl1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNCl1 BINDING SITE, designated SEQ ID:43776, to the nucleotide sequence of VGAM73 RNA, herein designated VGAM RNA, also designated SEQ ID:2784.

[8097] Another function of VGAM73 is therefore inhibition of Dynein, Cytoplasmic, Intermediate Polypeptide 1 (DNCl1, Accession XM_165838). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNCl1. HSPC031 (Accession NM_016101) is another VGAM73 host target gene. HSPC031 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC031, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC031 BINDING SITE, designated SEQ ID:18185, to the nucleotide sequence of VGAM73 RNA,

herein designated VGAM RNA, also designated SEQ ID:2784.

[8098] Another function of VGAM73 is therefore inhibition of HSPC031 (Accession NM_016101). Accordingly, utilities of VGAM73 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC031. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 74 (VGAM74) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8099] VGAM74 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM74 was detected is described hereinabove with reference to Figs. 1–8.

[8100] VGAM74 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Invertebrate Iridescent Virus 6. VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8101] VGAM74 gene encodes a VGAM74 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM74 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM74 precursor RNA is designated SEQ ID:60, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:60 is located at position 202596 relative to the genome of Invertebrate Iridescent Virus 6.

[8102] VGAM74 precursor RNA folds onto itself, forming VGAM74 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8103] An enzyme complex designated DICER COMPLEX, `dices` the VGAM74 folded precursor RNA into VGAM74 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM74 RNA is designated SEQ ID:2785, and is provided hereinbelow with reference to the sequence listing part.

[8104] VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM74 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8105] VGAM74 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM74 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM74 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8106] The complementary binding of VGAM74 RNA, herein designated VGAM RNA, to host target binding sites on VGAM74 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM74 host target RNA into VGAM74 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8107] It is appreciated that VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM74 host target genes. The mRNA of each one of this plurality of VGAM74 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM74 RNA, herein designated VGAM RNA, and which when bound by VGAM74 RNA causes inhibition of translation of respective one or more VGAM74 host target proteins.

[8108] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM74 gene, herein designated VGAM GENE, on one or more VGAM74 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8109] It is yet further appreciated that a function of VGAM74 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of viral infection by Invertebrate Iridescent Virus 6. Specific functions, and accordingly utilities, of VGAM74 correlate with, and may be deduced from, the identity of the host target genes which VGAM74 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8110] Nucleotide sequences of the VGAM74 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM74 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM74 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM74 are further described hereinbelow with reference to Table 1.

[8111] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM74 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM74 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8112] As mentioned hereinabove with reference to Fig. 1, a function of VGAM74 gene, herein designated VGAM is inhibition of expression of VGAM74 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM74 correlate with, and may be deduced from, the identity of the target genes which VGAM74 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8113] APPL (Accession NM_012096) is a VGAM74 host target gene. APPL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by APPL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of APPL BINDING SITE, designated SEQ ID:14400, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8114] A function of VGAM74 is therefore inhibition of APPL (Accession NM_012096). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with APPL. B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326) is another VGAM74 host target gene. BCL9 BINDING SITE is HOST

TARGET binding site found in the 5' untranslated region of mRNA encoded by BCL9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCL9 BINDING SITE, designated SEQ ID:10522, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8115] Another function of VGAM74 is therefore inhibition of B-cell CLL/lymphoma 9 (BCL9, Accession NM_004326), a gene which recruits of PYGO to the nuclear beta-catenin-TCF complex in Wnt/Wingless signaling. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCL9. The function of BCL9 has been established by previous studies. WNT (see OMIM Ref. No. 602863) signaling controls many fundamental processes during animal development. WNT transduction is mediated by the association of beta-catenin (OMIM Ref. No. 116806) with nuclear TCF (e.g., LEF1; 153245) DNA-binding factors. Kramps et al. (2002) identified 2 segment polarity genes in *Drosophila*, legless (Lgs), and pygopus (Pygo), and showed that their products are required for

WNT signal transduction at the level of nuclear beta-catenin. Lgs encodes the homolog of human BCL9, and the authors provided genetic and molecular evidence that these proteins exert their function by physically linking Pygo to beta-catenin. Kramps et al. (2002) identified 2 human homologs of the Drosophila Pygo gene, PYGO1 (OMIM Ref. No. 606902) and PYGO2 (OMIM Ref. No. 606903), that possess a highly conserved PHD finger that interacts with homology domain-1 (HD1) of BCL9. The findings suggested that the recruitment of PYGO permits beta-catenin to transcriptionally activate WNT target genes and raised the possibility that a deregulation of these events may play a causal role in the development of B-cell malignancies. Studying a cell line (OMIM Ref. No. CEMO-1) from a patient with precursor-B-cell acute lymphoblastic leukemia with a t(1;14)(q21;q32), Willis et al. (1998) identified a fusion partner of the IGHJ gene (OMIM Ref. No. 147010) on 14q. One allele showed novel sequences upstream of JH5 with no homology to either IGH or any other sequence in databases. Using a single-copy restriction fragment immediately 5-prime of JH5, PAC clones were isolated and mapped to 1q21 on normal metaphases by fluorescence in situ hybridization, con-

firming that this allele represented the translocation breakpoint. Sequence analysis of the 1q21 restriction fragment showed identity with an expressed sequenced tag, and this probe was therefore used to probe Northern blots.

- [8116] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8117] Kramps, T.; Peter, O.; Brunner, E.; Nellen, D.; Froesch, B.; Chatterjee, S.; Murone, M.; Zullig, S.; Basler, K. : Wnt/Wingless signaling requires BCL9/legless-mediated recruitment of pygopus to the nuclear beta-catenin-TCF complex. Cell 109: 47–60, 2002. ; and
- [8118] Willis, T. G.; Zalcberg, I. R.; Coignet, L. J. A.; Wlodarska, M.; Stul, D. M.; Jadayel, D. M.; Bastard, C.; Treleaven, J. G.; Catovsky, D.; Silva, M. L. M.; Dyer, M. J. S. : Molecular c.
- [8119] Further studies establishing the function and utilities of BCL9 are found in John Hopkins OMIM database record ID 602597, and in cited publications numbered 8254–8255 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761) is another VGAM74 host

target gene. CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CYP1A2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYP1A2 BINDING SITE1 and CYP1A2 BINDING SITE2, designated SEQ ID:6412 and SEQ ID:34256 respectively, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8120] Another function of VGAM74 is therefore inhibition of Cytochrome P450, Subfamily I (aromatic compound-inducible), Polypeptide 2 (CYP1A2, Accession NM_000761), a gene which intervenes in an NADPH-dependent electron transport pathway. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYP1A2. The function of CYP1A2 has been established by previous studies. P1-450 (CYP1A1; 108330) and P3-450 are 2 members of the dioxin-inducible P450 gene family. Jaiswal et al. (1987) determined the cDNA (3,064 bp) and protein (515 residues; M(r) = 58,294) sequences of P3-450. They showed by study of somatic cell hybrids that both the

P3-450 and the P1-450 loci reside on human chromosome 15. In the mouse and hamster, the 2 genes are located near the equivalent of the mannosephosphate isomerase (MPI) locus (OMIM Ref. No. 154550). The same may be true in man; MPI is located in the region 15q22-qter. The 2 CYP1 genes are within 25 kb of each other and probably are not separated by other genes (Nebert, 1988). The enzyme involved in O-deethylation of phenacetin is 1 of 9 forms of cytochrome P-450 that have been purified to electrophoretic homogeneity from human liver microsomes (Guengerich et al., 1986). Phenacetin O-deethylase differs from another cytochrome P-450 enzyme that shows genetic polymorphism, debrisoquine 4-hydroxylase (OMIM Ref. No. 124030), in molecular mass, amino acid composition, catalytic activity, and immunochemical properties. Butler et al. (1989) reviewed the evidence that phenacetin O-deethylase, otherwise known as P450(PA), is the product of the CYP1A2 gene. Devonshire et al. (1983) demonstrated a genetic polymorphism for phenacetin O-deethylation, with 5 to 10% of the population deficient in this activity. Cigarette smoking has been shown to increase microsomal phenacetin O-deethylase activity (Sesardic et al., 1988). Butler et al.

(1989) reported that human hepatic microsomal caffeine 3-demethylation, the initial major step in caffeine bio-transformation in humans, is selectively catalyzed by this cytochrome P-450. Estimation of caffeine 3-demethylation activity in humans may be useful in the characterization of arylamine N-oxidation phenotypes and in the assessment of whether or not the hepatic levels of this cytochrome, as affected by environmental or genetic factors, contribute to interindividual differences in susceptibility to arylamine-induced cancers. Smokers have been demonstrated to have increased rates of caffeine disposition, with plasma half lives one-half that of non-smokers. Furthermore, rates of caffeine metabolism vary between individuals, as caffeine half-life values ranging from 1.5 to 9.5 hours have been reported. Buters et al. (1996) showed that in mice the clearance of caffeine is determined primarily by CYP1A2.

[8121] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8122] Butler, M. A.; Iwasaki, M.; Guengerich, F. P.; Kadlubar, F. F. : Human cytochrome P-450(PA) (P-450IA2), the phenacetin O-deethylase, is primarily responsible for the

hepatic 3-demethylation of caffeine and N-oxidation of carcinogenic arylamines. Proc. Nat. Acad. Sci. 86: 7696-7700, 1989. ; and

[8123] Christiansen, L.; Bygum, A.; Jensen, A.; Thomsen, K.; Brandrup, F.; Horder, M.; Petersen, N. E. : Association between CYP1A2 polymorphism and susceptibility to porphyria cutanea tarda.

[8124] Further studies establishing the function and utilities of CYP1A2 are found in John Hopkins OMIM database record ID 124060, and in cited publications numbered 11772-11775, 3682, 11776-1177 and 12761-11782 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662) is another VGAM74 host target gene. DISC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DISC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DISC1 BINDING SITE, designated SEQ ID:20736, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8125] Another function of VGAM74 is therefore inhibition of Disrupted In Schizophrenia 1 (DISC1, Accession NM_018662), a gene which has globular N-terminal domain(s) and a helical C-terminal domain. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DISC1. The function of DISC1 has been established by previous studies. Millar et al. (2000) isolated and sequenced the breakpoints on chromosomes 1 and 11 in the Scottish family carrying the translocation, and by sequence analysis concluded that no genes were within the region surrounding the chromosome 11 breakpoint. The authors found that, by contrast, the corresponding region on chromosome 1 was gene-dense and that not 1, but 2, novel genes were directly disrupted by the translocation. They named these genes 'disrupted in schizophrenia' 1 and 2 (DISC1 and DISC2, 606271). The major DISC1 transcript is approximately 7.5 kb, contains an open reading frame encoding 854 amino acids, and is ubiquitously expressed. The protein is predicted to consist of a globular N-terminal domain(s) and helical C-terminal domain that has the potential to form a coiled-coil by interaction with another protein(s). Similar structures are thought to be

present in a variety of unrelated proteins that are known to function in the nervous system. The putative structure of the protein encoded by DISC1 is therefore compatible with a role in the nervous system. DISC2 apparently specifies a single exon thought to be a noncoding RNA molecule that is antisense to DISC1, an arrangement that has been observed at other loci where the antisense RNA may regulate expression of the sense gene. The authors concluded that DISC1 and DISC2 should be considered formal candidate genes for susceptibility to psychiatric illness. The family studied by St. Clair et al. (1990) and Millar et al. (2000) was originally ascertained by Jacobs et al. (1970), who reported the translocation in the proband, who had adolescent conduct disorder, and in members of 4 generations of the extended family. Blackwood et al. (2001) provided a follow-up. Of the 87 members of the family who were karyotyped, 37 carried the translocation. A psychiatric diagnosis was reached in 29 carriers, 38 noncarriers, and the 2 founders (who were not karyotyped). The range of symptoms in this family crossed traditional diagnostic boundaries, and the locus identified by the breakpoint on 1q42 appeared to be implicated in either schizophrenia or bipolar disorder. Furthermore,

Blackwood (2000) reported abnormalities in the auditory P300 event-related potential, which showed prolonged latency and reduced amplitude in affected members of the family.

[8126] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8127] Blackwood, D. H. R.; Fordyce, A.; Walker, M. T.; St. Clair, D. M.; Porteous, D. J.; Muir, W. J. : Schizophrenia and affective disorders--cosegregation with a translocation at chromosome 1q42 that directly disrupts brain-expressed genes: clinical and P300 findings in a family. *Am. J. Hum. Genet.* 69: 428–433, 2001. ; and

[8128] Ekelund, J.; Hovatta, I.; Parker, A.; Paunio, T.; Varilo, T.; Martin, R.; Suhonen, J.; Ellonen, P.; Chan, G.; Sinsheimer, J. S.; Sobel, E.; Juvonen, H.; Arajärvi, R.; Partonen, T.; Suv.

[8129] Further studies establishing the function and utilities of DISC1 are found in John Hopkins OMIM database record ID 605210, and in cited publications numbered 6819–6821, 407 and 6822–6823 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052) is another VGAM74 host target gene.

DSCR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DSCR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DSCR3 BINDING SITE, designated SEQ ID:12685, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8130] Another function of VGAM74 is therefore inhibition of Down Syndrome Critical Region Gene 3 (DSCR3, Accession NM_006052). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DSCR3. FCRH1 (Accession NM_052938) is another VGAM74 host target gene. FCRH1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FCRH1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FCRH1 BINDING SITE, designated SEQ ID:27499, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8131] Another function of VGAM74 is therefore inhibition of FCRH1 (Accession NM_052938). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FCRH1. Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549) is another VGAM74 host target gene. FEZ1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FEZ1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEZ1 BINDING SITE, designated SEQ ID:22877, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8132] Another function of VGAM74 is therefore inhibition of Fasciculation and Elongation Protein Zeta 1 (zygin I) (FEZ1, Accession NM_022549), a gene which Zygin 1; may have a role in axonal outgrowth; has similarity to *C. elegans* UNC-76. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEZ1. The function of FEZ1 and its association with various diseases and clinical conditions, has been established by previous studies, as described

hereinabove with reference to VGAM37. Growth Hormone Receptor (GHR, Accession NM_000163) is another VGAM74 host target gene. GHR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GHR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GHR BINDING SITE, designated SEQ ID:5673, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8133] Another function of VGAM74 is therefore inhibition of Growth Hormone Receptor (GHR, Accession NM_000163). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GHR. Mediterranean Fever (MEFV, Accession NM_000243) is another VGAM74 host target gene. MEFV BINDING SITE1 and MEFV BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEFV, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEFV BINDING SITE1 and

MEFV BINDING SITE2, designated SEQ ID:5769 and SEQ ID:5770 respectively, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8134] Another function of VGAM74 is therefore inhibition of Mediterranean Fever (MEFV, Accession NM_000243). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEFV. Protocadherin Beta 9 (PCDHB9, Accession NM_019119) is another VGAM74 host target gene. PCDHB9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDHB9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCDHB9 BINDING SITE, designated SEQ ID:21205, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8135] Another function of VGAM74 is therefore inhibition of Protocadherin Beta 9 (PCDHB9, Accession NM_019119), a gene which is a potential calcium-dependent cell-adhesion protein. Accordingly, utilities of VGAM74 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDHB9. The function of PCDHB9 has been established by previous studies. Cadherins are calcium-dependent cell-cell adhesion molecules that mediate neural cell-cell interactions. Protocadherins constitute a subfamily of nonclassic cadherins. PCDHB9 is a member of the beta cluster of protocadherin genes on 5q31. For specific information on the PCDHB genes, see 604967. Vanhalst et al. (2001) determined that unlike most PCDHB proteins, PCDHB9 has not 1 but 2 PXXP motifs, putative SH3 protein-binding sites, at the end of the conserved region of its cytoplasmic domain.

[8136] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8137] Vanhalst, K.; Kools, P.; Eynde, E. V.; van Roy, F. : The human and murine protocadherin-beta one-exon gene families show high evolutionary conservation, despite the difference in gene number. FEBS Lett. 495: 120-125, 2001. ; and

[8138] Wu, Q.; Zhang, T.; Cheng, J.-F.; Kim, Y.; Grimwood, J.; Schmutz, J.; Dickson, M.; Noonan, J. P.; Zhang, M. Q.; My-

ers, R. M.; Maniatis, T. : Comparative DNA sequence analysis of mouse a.

[8139] Further studies establishing the function and utilities of PCDHB9 are found in John Hopkins OMIM database record ID 606335, and in cited publications numbered 674 and 9535 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283) is another VGAM74 host target gene. PDE6B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE6B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE6B BINDING SITE, designated SEQ ID:5828, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8140] Another function of VGAM74 is therefore inhibition of Phosphodiesterase 6B, CGMP-specific, Rod, Beta (congenital stationary night blindness 3, autosomal dominant) (PDE6B, Accession NM_000283). Accordingly, utili-

ties of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE6B. Period Homolog 2 (Drosophila) (PER2, Accession NM_022817) is another VGAM74 host target gene. PER2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PER2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PER2 BINDING SITE, designated SEQ ID:23091, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8141] Another function of VGAM74 is therefore inhibition of Period Homolog 2 (Drosophila) (PER2, Accession NM_022817), a gene which Period homolog 2; putative circadian clock protein; has a PAS dimerization domain. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PER2. The function of PER2 has been established by previous studies. To investigate the biologic role of NPAS2 (OMIM Ref. No. 603347), Reick et al. (2001) prepared a neuroblastoma cell line capable of conditional induction of the NPAS2:BMAL1 (OMIM Ref. No. 602550)

heterodimer and identified putative target genes by representational difference analysis, DNA microarrays, and Northern blotting. Coinduction of NPAS2 and BMAL1 activated transcription of the endogenous Per1, Per2, and Cry1 (OMIM Ref. No. 601933) genes, which encode negatively activating components of the circadian regulatory apparatus, and repressed transcription of the endogenous BMAL1 gene. Analysis of the frontal cortex of wildtype mice kept in a 24-hour light-dark cycle revealed that Per1, Per2, and Cry1 mRNA levels were elevated during darkness and reduced during light, whereas BMAL1 mRNA displayed the opposite pattern. In situ hybridization assays of mice kept in constant darkness revealed that Per2 mRNA abundance did not oscillate as a function of circadian cycle in NPAS2-deficient mice. Thus, NPAS2 likely functions as part of a molecular clock operative in the mammalian forebrain. Animal model experiments lend further support to the function of PER2. Shearman et al. (2000) demonstrated that in the mouse, the core mechanism for the master circadian clock consists of interacting positive and negative transcription and translation feedback loops. Analysis of Clock/Clock (OMIM Ref. No. 601851) mutant mice, homozygous Per2 mutants, and

Cry-deficient mice revealed substantially altered Bmal1 (OMIM Ref. No. 602550) rhythms, consistent with a dominant role of Per2 in the positive regulation of the Bmal1 loop. In vitro analysis of Cry inhibition of Clock:Bmal1-mediated transcription shows that the inhibition is through direct protein-protein interactions, independent of the Per and Tim (OMIM Ref. No. 603887) proteins. Per2 is a positive regulator of the Bmal1 loop, and Cry1 and Cry2 are the negative regulators of the Period and Cryptochrome cycles.

[8142] It is appreciated that the abovementioned animal model for PER2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8143] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8144] Shearman, L. P.; Sriram, S.; Weaver, D. R.; Maywood, E. S.; Chaves, I.; Zheng, B.; Kume, K.; Lee, C. C.; van der Horst, G. T. J.; Hastings, M. H.; Reppert, S. M. : Interacting molecular loops in the mammalian circadian clock. Science 288: 1013-1019, 2000. ; and

F., Jr.; Reppert, S. M. : Two period homologs: circadian expression and photic regulation in the suprachiasmatic nuclei. Neu.

[8146] Further studies establishing the function and utilities of PER2 are found in John Hopkins OMIM database record ID 603426, and in cited publications numbered 933, 957, 6264–6265, 1256, 8191–819 and 8673 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400) is another VGAM74 host target gene. PLA2G2D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLA2G2D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLA2G2D BINDING SITE, designated SEQ ID:14767, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8147] Another function of VGAM74 is therefore inhibition of Phospholipase A2, Group IID (PLA2G2D, Accession NM_012400), a gene which is involved in phospholipid digestion, remodeling of cell membranes, and host defense,

as well as pathophysiologic processes. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLA2G2D. The function of PLA2G2D has been established by previous studies. Phospholipase A2 (PLA2) family members (e.g., PLA2G2A; 172411) are lipolytic enzymes that hydrolyze the sn-2 fatty acid ester bond of glycerophospholipids to produce free fatty acid and lysophospholipids. PLA2s are involved in phospholipid digestion, remodeling of cell membranes, and host defense, as well as pathophysiologic processes involving the production of prostaglandins, leukotrienes, thromboxanes, and platelet-activating factor. By searching an EST database using the catalytically essential residues of secretory PLA2s as the probe, followed by PCR of mouse and human spleen cDNA, Ishizaki et al. (1999) obtained cDNAs encoding mouse and human PLA2G2D. Sequence analysis predicted that the 145-amino acid human secretory protein, 48% identical to PLA2G2A, contains a 20-residue signal peptide, a potential N-linked glycosylation site, 14 cysteine residues, and conserved His48 and Asp49 sites. Analysis of enzymatic activity detected most activity in culture supernatant and determined that PLA2G2D preferentially hydrolyzes

phosphatidylglycerol and phosphatidylethanolamine, followed by phosphatidylcholine, but does not hydrolyze phosphatidylserine or phosphatidic acid. Northern blot analysis revealed variable expression of 2.0- and 1.0-kb transcripts, with highest expression in pancreas and spleen. In a rat model, expression in thymus increased dramatically after lipopolysaccharide injection. By subtractive cDNA cloning using spleens from wildtype and tumor necrosis factor (Tnf; 191160)/lymphotoxin-alpha (Lta; 153440) double-knockout mice, followed by probing a spleen cDNA library, Shakhov et al. (2000) isolated a cDNA encoding mouse Pla2g2d, which they designated Splash (secretory-type PLA, stroma-associated homolog). Splash was expressed 6-fold less in mutant than wildtype mice. By screening a human cDNA library, they isolated cDNAs encoding human PLA2G2D. Shakhov et al. (2000) noted that the human and mouse protein sequences are 73% identical and 81% homologous. Northern blot analysis detected mouse Pla2g2d expression in adult but not embryonic spleen. By radiation hybrid mapping, Ishizaki et al. (1999) mapped the PLA2G2D gene to 1p36.12. Also using radiation hybrid analysis, Shakhov et al. (2000) mapped the PLA2G2D gene to 1p36.1-p35, near the PLA2G2A

gene and a region known for frequent loss of heterozygosity in human tumors. Shakhov et al. (2000) mapped the mouse gene to chromosome 4.

[8148] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8149] Ishizaki, J.; Suzuki, N.; Higashino, K.; Yokota, Y.; Ono, T.; Kawamoto, K.; Fujii, N.; Arita, H.; Hanasaki, K. : Cloning and characterization of novel mouse and human secretory phospholipase A(2)s. J. Biol. Chem. 274: 24973–24979, 1999. ; and

[8150] Shakhov, A. N.; Rubtsov, A. V.; Lyakhov, I. G.; Tumanov, A. V.; Nedospasov, S. A. : SPLASH (PLA(2)IID), a novel member of phospholipase A2 family, is associated with lymphotoxin-defici.

[8151] Further studies establishing the function and utilities of PLA2G2D are found in John Hopkins OMIM database record ID 605630, and in cited publications numbered 6963 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rhesus Blood Group, D Antigen (RHD, Accession NM_016124) is another VGAM74 host target gene. RHD BINDING SITE1 and RHD BINDING SITE2 are HOST TARGET binding sites found in

untranslated regions of mRNA encoded by RHD, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHD BINDING SITE1 and RHD BINDING SITE2, designated SEQ ID:18217 and SEQ ID:18337 respectively, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8152] Another function of VGAM74 is therefore inhibition of Rhesus Blood Group, D Antigen (RHD, Accession NM_016124), a gene which Major antigen of the RH system. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHD. The function of RHD has been established by previous studies. Bennett et al. (1993) demonstrated that DNA testing can be used to determine RhD type in chorionic villus samples or amniotic cells. An RhD-negative woman whose partner is heterozygous may have preexisting anti-RhD antibodies that may or may not affect a subsequent fetus, depending on whether it is heterozygous. A safe method of determining fetal RhD type early in pregnancy would eliminate the risks to an RhD-negative fetus of fetal blood sampling or serial amniocen-

teses. Levine et al. (1941) showed that hemolytic disease of the fetus occurs in an RhD-positive fetus carried by an RhD-negative woman who has been immunized by transplacental passage of RhD-positive red cells during a previous pregnancy. When the father of the fetus being carried by a sensitized RhD-negative woman is heterozygous for RhD, as more than 50% of people are, half the fetuses will be RhD-negative and therefore require no treatment to avoid erythroblastosis fetalis. The others will be RhD-positive and require sophisticated investigative measures and treatments. Lo et al. (1998) described a noninvasive method of determining fetal RhD status by analyzing maternal plasma. Using a fluorescent-based PCR assay that was sensitive enough to detect the amount of RhD DNA found in a single cell, they determined the RhD status of singleton fetuses from 57 RhD-negative women whose partners were heterozygous for the RhD gene. This method correctly identified the RhD status of 10 of 12 fetuses whose mothers were in their first trimester of pregnancy, that of all 30 fetuses whose mothers were in their second trimester, and that of all 15 fetuses whose mothers were in their third trimester. The method they described was rapid, providing results within 1 day, and rep-

resented a major advance in RhD genotyping.

[8153] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8154] Bennett, P. R.; Le Van Kim, C.; Colin, Y.; Warwick, R. M.; Cherif-Zahar, B.; Fisk, N. M.; Cartron, J.-P. : Prenatal determination of fetal RhD type by DNA amplification. New Eng. J. Med. 329: 607-610, 1993. ; and

[8155] Lo, Y. M. D.; Hjelm, N. M.; Fidler, C.; Sargent, I. L.; Murphy, M. F.; Chamberlain, P. F.; Poon, P. M. K.; Redman, C. W. G.; Wainscoat, J. S. : Prenatal diagnosis of fetal RhD status by mol.

[8156] Further studies establishing the function and utilities of RHD are found in John Hopkins OMIM database record ID 111680, and in cited publications numbered 3747-3776 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Selenoprotein N, 1 (SEPN1, Accession XM_039033) is another VGAM74 host target gene. SEPN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEPN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SEPN1 BINDING SITE, designated SEQ ID:32989, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8157] Another function of VGAM74 is therefore inhibition of Selenoprotein N, 1 (SEPN1, Accession XM_039033). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SEPN1. Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444) is another VGAM74 host target gene. SLC13A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC13A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC13A1 BINDING SITE, designated SEQ ID:22775, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8158] Another function of VGAM74 is therefore inhibition of Solute Carrier Family 13 (sodium/sulfate symporters), Member 1 (SLC13A1, Accession NM_022444). Accordingly, utilities of VGAM74 include diagnosis, prevention and

treatment of diseases and clinical conditions associated with SLC13A1. Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163) is another VGAM74 host target gene. SLC14A2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SLC14A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC14A2 BINDING SITE, designated SEQ ID:14009, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8159] Another function of VGAM74 is therefore inhibition of Solute Carrier Family 14 (urea transporter), Member 2 (SLC14A2, Accession NM_007163), a gene which is a renal urea transporter 2. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC14A2. The function of SLC14A2 has been established by previous studies. Genetic variation in proteins that determine sodium reabsorption and excretion significantly influences blood pressure. Ranade et al. (2001) investigated whether nucleotide variation in human UT2 could be associated with

variation in blood pressure. Seven single-nucleotide polymorphisms (SNPs) were identified, including val227 to ile and ala357 to thr. Over 1,000 hypertensive and low-normotensive individuals of Chinese origin were genotyped. The ile227 and ala357 alleles were associated with low diastolic blood pressure in men but not women, with odds ratios 2.1 (95% confidence interval 1.5–2.7, P less than 0.001) and 1.5 (95% confidence interval 1.2–1.8, P less than 0.001), respectively. There was a similar trend for systolic blood pressure, and odds ratios for the ile227 and ala357 alleles were 1.7 (95% confidence interval 1.2–2.3, $P = 0.002$) and 1.3 (95% confidence interval 1.1–1.6, $P = 0.007$), respectively, in men. DeStefano et al. (1998) identified a locus for orthostatic hypotension (OHDS; 143850) on chromosome 18q, with a peak lod score of 3.92 at D18S1367 in 2 linked families. The proximity of human UT2 makes it a potential candidate gene for this autosomal dominant disorder.

[8160] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8161] Ranade, K.; Wu, K.-W.; Hwu, C.-M.; Ting, C.-T.; Pei, D.; Pesich, R.; Hebert, J.; Chen, Y.-D. I.; Pratt, R.; Olshen, R.;

Masaki, K.; Risch, N.; Cox, D. R.; Botstein, D. : Genetic variation in the human urea transporter-2 is associated with variation in blood pressure. Hum. Molec. Genet. 10: 2157-2164, 2001. ; and

[8162] DeStefano, A. L.; Baldwin, C. T.; Burzstyn, M.; Gavras, I.; Handy, D. E.; Joost, O.; Martel, T.; Nicolaou, M.; Schwartz, F.; Streeten, D. H. P.; Farrer, L. A.; Gavras, H. : Autosomal domin.

[8163] Further studies establishing the function and utilities of SLC14A2 are found in John Hopkins OMIM database record ID 601611, and in cited publications numbered 12144-9111 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073) is another VGAM74 host target gene. SLC15A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC15A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC15A1 BINDING SITE, designated SEQ ID:11521, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA,

also designated SEQ ID:2785.

[8164] Another function of VGAM74 is therefore inhibition of Solute Carrier Family 15 (oligopeptide transporter), Member 1 (SLC15A1, Accession NM_005073), a gene which is a H(+)-coupled peptide transporter. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC15A1. The function of SLC15A1 has been established by previous studies. In mammalian small intestine, the proton-coupled peptide transporter is responsible for the absorption of small peptides arising from digestion of dietary proteins. Fei et al. (1994) isolated a cDNA clone encoding a hydrogen ion/peptide cotransporter from a rabbit intestinal cDNA library. Liang et al. (1995) screened a human intestinal cDNA library with a probe derived from the rabbit cotransporter cDNA and identified a cDNA which, when expressed in HeLa cells or in *Xenopus laevis* oocytes, induced proton-dependent peptide transport activity. The predicted protein consisted of 708 amino acids with 12 membrane-spanning domains and 2 putative sites for protein kinase C-dependent phosphorylation. The cDNA-induced transport process accepted dipeptides, tripeptides, and amino beta-lactam antibiotics as sub-

strates, but could not transport free amino acids. The human cotransporter showed 81% identity and 92% similarity to the rabbit cotransporter, but showed only a weak homology to the proton-coupled peptide transport proteins present in bacteria and yeast. By analysis of somatic cell hybrids and by isotopic in situ hybridization, Liang et al. (1995) mapped the human gene to 13q33-q34. Adibi (1997) reviewed the biology and function of the human intestinal oligopeptide transporter, which he symbolized PEPT1. Studies indicated that it transports dipeptides and tripeptides but not free amino acids or peptides with more than 3 amino acid residues and that its driving force for uphill transport requires proton binding and presence of an inside-negative membrane potential. A membrane protein, HTP1, which appeared to be associated with the oligopeptide transporter, had also been cloned. Adibi (1997) pointed out the importance of the transporter in nutritional and pharmacologic therapies; for example, it has allowed the use of oligopeptides as a source of nitrogen for enteral feeding and the use of the oral route for delivery of peptidomimetic drugs such as beta-lactam antibiotics.

[8165] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [8166] Liang, R.; Fei, Y.-J.; Prasad, P. D.; Ramamoorthy, S.; Han, H.; Yang-Feng, T. L.; Hediger, M. A.; Ganapathy, V.; Leibach, F. H. : Human intestinal H(+)/peptide cotransporter: cloning, functional expression, and chromosomal localization. J. Biol. Chem. 270: 6456–6463, 1995. ; and
- [8167] Adibi, S. A. : The oligopeptide transporter (Pept-1) in human intestine: biology and function. Gastroenterology 113: 332–340, 1997.

[8168] Further studies establishing the function and utilities of SLC15A1 are found in John Hopkins OMIM database record ID 600544, and in cited publications numbered 7871–7873 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SMAC (Accession NM_138930) is another VGAM74 host target gene. SMAC BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SMAC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMAC BINDING SITE, designated SEQ ID:29051, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8169] Another function of VGAM74 is therefore inhibition of SMAC (Accession NM_138930), a gene which promotes apoptosis via caspase activation. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMAC. The function of SMAC has been established by previous studies. Verhagen et al. (2000) identified the murine homolog of SMAC, which they called DIABLO (direct IAP-binding protein with low pI). They showed that DIABLO

can bind mammalian IAP homolog A (MIHA, or API3) and can also interact with MIHB (API1; 601712), MIHC (API2; 601721), and OpiAP, the baculoviral IAP. Immunoprecipitation and Western blot analysis indicated that the N-terminally processed, IAP-interacting form of DIABLO is concentrated in membrane fractions in healthy cells but is released into the MIHA-containing cytosolic fractions upon ultraviolet (UV) irradiation. Since transfection of cells with DIABLO was able to counter the protection afforded by MIHA against UV irradiation, the authors suggested that DIABLO may promote apoptosis by binding to IAPs and preventing them from inhibiting caspases. Chai et al. (2000) showed that SMAC/DIABLO promotes not only the proteolytic activation of procaspase-3, but also the enzymatic activity of mature caspase-3, both of which depend upon its ability to interact physically with IAPs. Animal model experiments lend further support to the function of SMAC. Okada et al. (2002) generated Diablo-deficient mice by homologous recombination. Western blot analysis confirmed the null mutation. The mice were fertile and appeared grossly normal at more than 1 year of age, and histologic analysis failed to detect any abnormalities. In vitro analysis indicated an inhibition of procaspase-3

(CASP3; 600636) cleavage in Diablo $-/-$ cell lysates, but all types of Diablo $-/-$ cells tested responded normally to a number of apoptotic stimuli. Fas (OMIM Ref. No. 134637)-mediated apoptosis in liver was also normal in vivo in these mice. The authors concluded that a redundant molecule, possibly Omi (PRSS25; 606441), or molecules are capable of compensating for the loss of Diablo function. Alternatively, they suggested that Diablo may only regulate programmed cell death in specific situations or tissues not yet identified.

[8170] It is appreciated that the abovementioned animal model for SMAC is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8171] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8172] Okada, H.; Suh, W.-K.; Jin, J.; Woo, M.; Du, C.; Elia, A.; Duncan, G. S.; Wakeham, A.; Itie, A.; Lowe, S. W.; Wang, X.; Mak, T. W. : Generation and characterization of Smac/DIABLO-deficient mice. *Molec. Cell. Biol.* 22: 3509-3517, 2002. ; and

nolly, L. M.; Reid, G. E.; Moritz, R. L.; Simpson, R. J.; Vaux, D. L. : Identification of DIABLO, a mammalian protein that promote.

[8174] Further studies establishing the function and utilities of SMAC are found in John Hopkins OMIM database record ID 605219, and in cited publications numbered 6969–6970, 9213–6972, 921 and 8837 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sorting Nexin 15 (SNX15, Accession XM_057307) is another VGAM74 host target gene. SNX15 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX15, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX15 BINDING SITE, designated SEQ ID:36505, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8175] Another function of VGAM74 is therefore inhibition of Sorting Nexin 15 (SNX15, Accession XM_057307). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX15. Synovial Sarcoma Translocation, Chro-

mosome 18 (SS18, Accession NM_005637) is another VGAM74 host target gene. SS18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SS18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SS18 BINDING SITE, designated SEQ ID:12164, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8176] Another function of VGAM74 is therefore inhibition of Synovial Sarcoma Translocation, Chromosome 18 (SS18, Accession NM_005637), a gene which is a putative transcriptional activator. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SS18. The function of SS18 has been established by previous studies. Human synovial sarcomas contain a recurrent and specific chromosomal translocation t(X;18)(p11.2;q11.2). By screening a synovial sarcoma cDNA library with a YAC spanning the X chromosome breakpoint, Clark et al. (1994) identified a hybrid transcript that contained 5-prime sequences mapping to chromosome 18 and 3-prime sequences mapping

to the X chromosome (see OMIM Ref. No. SSX1; 312820). A probe from the chromosome 18 gene sequence, symbolized SS18, detected genomic rearrangements in 10 of 13 synovial sarcomas. The chromosome 18 gene was symbolized SYT by Clark et al. (1994), but that symbol had already been used for synaptotagmin (OMIM Ref. No. 185605). Sequencing of cDNA clones showed that the normal SS18 gene encodes a protein rich in glutamine, proline, and glycine, and that in synovial sarcoma, rearrangement of the SS18 gene results in the formation of a fusion protein. Both the chromosome 18 and the X chromosome components failed to exhibit significant homology to known gene sequences. The SYT protein appears to act as a transcriptional coactivator and the SSX proteins as corepressors. Thaete et al. (1999) investigated the functional domains of the proteins. The SYT protein was found to contain a novel conserved 54-amino acid domain at the N terminus of the protein (the SNH domain) that is found in proteins from a wide variety of species, and a C-terminal domain, rich in glutamine, proline, glycine, and tyrosine (the QPGY domain), which contains the transcriptional activator sequences. Deletion of the SNH domain resulted in a more active transcriptional activator, sug-

gesting that this domain acts as an inhibitor of the activation domain. The C-terminal SSX domain present in the SYT-SSX translocation protein contributes a transcriptional repressor domain to the protein. Thus, the fusion protein has transcriptional activating and repressing domains. Thaete et al. (1999) demonstrated that the human homolog of the SNF2/Brahma protein BRM (SMARCA2; 600014) colocalizes with SYT and SYT-SSX in nuclear speckles, and also interacts with SYT and SYT-SSX proteins in vitro. They suggested that this interaction may provide an explanation of how the SYT protein activates gene transcription.

[8177] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8179] Thaete, C.; Brett, D.; Monaghan, P.; Whitehouse, S.; Rennie, G.; Rayner, E.; Cooper, C. S.; Goodwin, G. : Functional domains of the SYT and SYT-SSX synovial sarcoma

translocation prote.

[8180] Further studies establishing the function and utilities of SS18 are found in John Hopkins OMIM database record ID 600192, and in cited publications numbered 10626, 11390-10117, 9147-914 and 10118 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tripartite Motif-containing 9 (TRIM9, Accession NM_015163) is another VGAM74 host target gene. TRIM9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by TRIM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM9 BINDING SITE, designated SEQ ID:17515, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8181] Another function of VGAM74 is therefore inhibition of Tripartite Motif-containing 9 (TRIM9, Accession NM_015163), a gene which may function as a positive regulator for mannosylphosphate transferase and is required to mediate mannosylphosphate transfer in both the core and outer chain portions of n-linked. oligosaccha-

rides. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM9. The function of TRIM9 has been established by previous studies. TRIM proteins are composed of 3 zinc-binding domains, a RING, a B-box type 1, and a B-box type 2, followed by a coiled-coil region. They are involved in development and cell growth. By EST database searching for B-box-containing proteins, Reymond et al. (2001) identified 37 TRIM members, including 3 isoforms of TRIM9. Northern blot analysis revealed high expression of a 4.4-kb TRIM9 transcript in brain. Fluorescence microscopy demonstrated expression of TRIM9 in cytoplasmic speckles. Interaction mating analysis indicated that TRIM9 can form a homodimer.

[8182] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8183] Li, Y.; Chin, L.-S.; Weigel, C.; Li, L. : Spring, a novel RING finger protein that regulates synaptic vesicle exocytosis. *J. Biol. Chem.* 276: 40824–40833, 2001. ; and

[8184] Reymond, A.; Meroni, G.; Fantozzi, A.; Merla, G.; Cairo, S.; Luzi, L.; Riganelli, D.; Zanaria, E.; Messali, S.; Cainarca, S.; Guffanti, A.; Minucci, S.; Pelicci, P. G.; Ballabio, A. .:

[8185] Further studies establishing the function and utilities of TRIM9 are found in John Hopkins OMIM database record ID 606555, and in cited publications numbered 4517–4518 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. UDP–glucose Dehydrogenase (UGDH, Accession NM_003359) is another VGAM74 host target gene. UGDH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UGDH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UGDH BINDING SITE, designated SEQ ID:9388, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8186] Another function of VGAM74 is therefore inhibition of UDP–glucose Dehydrogenase (UGDH, Accession NM_003359), a gene which is an UDP–glucose dehydrogenase. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UGDH. The function of UGDH has been established by previous studies. Spicer et al. (1998) conducted expression studies that indicated that treat–

ment of human fibroblasts with proinflammatory cytokines, such as interleukin-1-beta (OMIM Ref. No. 147720), under conditions that dramatically increase hyaluronan synthesis, also led to a substantial but transient increase in the expression of UGDH. The authors suggested that glycosaminoglycan biosynthesis may be partly regulated by the availability of activated UDP-glucuronate, as determined by relative Udpgdh expression. Animal model experiments lend further support to the function of UGDH. Zebrafish 'jekyll' mutants are deficient in the initiation of heart valve formation. Walsh and Stainier (2001) identified the jekyll mutation as a T-to-A change at basepair 992, resulting in an isoleucine-to-aspartic acid substitution at residue 331 in the zebrafish UDP-glucose dehydrogenase gene. The isoleucine at position 331 is conserved in Drosophila, human, and zebrafish Ugdh and is situated in a pocket of nonpolar amino acids in the 'hinge' of the omega loop gate that allows UDP-glucose access to the active site of the enzyme. While other mutations that affect heparan sulfate proteoglycans in vertebrates result in defects during gastrulation, jekyll exhibits no manifestations until organogenesis. Walsh and Stainier (2001) suggested one explanation

for this incongruity is that zebrafish UdgH mRNA is provided maternally. The atrioventricular border cells do not differentiate from their neighbors in jekyll mutants, suggesting that jekyll is required in a cell signaling event that establishes a boundary between the atrium and the ventricle. Walsh and Stainier (2001) demonstrated that jekyll functions early in the process of atrioventricular valve formation and is required specifically in patterning the myocardium and endocardium at the atrioventricular boundary. The myocardial patterning defects seen in jekyll mutants are likely direct effects of the loss of jekyll function because they are the first molecular defects to be observed, whereas the later endocardial defects may be secondary to the lack of Bmp4 (OMIM Ref. No. 112262) restriction in the myocardium.

[8187] It is appreciated that the abovementioned animal model for UGDH is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8188] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Molecular cloning and characterization of the human and mouse UDP-glucose dehydrogenase genes. J. Biol. Chem. 273: 25117–25124, 1998. ; and

[8190] Walsh, E. C.; Stainier, D. Y. R. : UDP-glucose dehydrogenase required for cardiac valve formation in zebrafish. Science 293: 1670–1674, 2001.

[8191] Further studies establishing the function and utilities of UGDH are found in John Hopkins OMIM database record ID 603370, and in cited publications numbered 8512–8516 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1 (YES1, Accession NM_005433) is another VGAM74 host target gene. YES1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YES1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of YES1 BINDING SITE, designated SEQ ID:11914, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8192] Another function of VGAM74 is therefore inhibition of V–yes–1 Yamaguchi Sarcoma Viral Oncogene Homolog 1

(YES1, Accession NM_005433), a gene which is a putative protein-tyrosine kinase. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YES1. The function of YES1 has been established by previous studies. The YES oncogene is homologous to the gene of the Yamaguchi sarcoma virus. The product of the gene is associated with tyrosine-specific protein kinase activity and its amino acid sequence shows a high degree of homology with that of the SRC gene product of Rous sarcoma virus. Semba et al. (1985) found in DNA from human embryo fibroblasts 10 EcoRI fragments that hybridized with the Yamaguchi sarcoma virus oncogene. Four of these (designated YES1) were assigned to chromosome 18 and 1 (designated YES2) was assigned to chromosome 6 by a study of human-mouse cell hybrids. (YES2 was later found (Semba et al., 1988) to be a pseudogene of YES1 and to be located at 22q11.2. Semba et al. (1988) stated: 'The failure of proper mapping in our earlier experiment might have been caused by instability of hybrid cell clones.') The other 5 fragments could not be mapped either because hybridization signals were too weak or differentiation from mouse YES fragments was impossible. There was evidence for

multiple copies of YES-related genes in the human genome, but only a single RNA species, 4.8 kb long, was found. At least 3 of the human YES gene copies had both introns and exons and 1 gene copy appeared to be a pseudogene. By isotopic in situ hybridization, Yoshida et al. (1985) mapped the YES1 gene to 18q21.3. These workers suggested that the localization is consistent with a role in the pathogenesis of follicular lymphoma, which is frequently associated with a 14;18 translocation with the breakpoint at 18q21 (Fukuhara et al., 1979); see 151430. Ohno et al. (1987) found that although it is in the same chromosome region as BCL2 (OMIM Ref. No. 151430), the YES gene is intact in cases of follicular lymphoma. Using yeast artificial chromosomes (YACs) containing the YES1 gene as probes and fluorescence in situ hybridization, Silverman et al. (1993) detected a strong signal in the region corresponding to 18p11.3. These YACs were found to contain another 18p11.32 gene, thymidylate synthase (OMIM Ref. No. 188350); the genes were less than 50 kb apart. Overhauser et al. (1993) identified a sequence tagged site (STS) in the YES1 gene and used it in studies of somatic cell hybrids with deletion of various segments of chromosome 18 to map the gene to 18pter-p11.21.

- [8193] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8194] Semba, K.; Yamanashi, Y.; Nishizawa, M.; Sukegawa, J.; Yoshida, M.; Sasaki, M.; Yamamoto, T.; Toyoshima, K. : Location of the c-yes gene on the human chromosome and its expression in various tissues. Science 227: 1038–1040, 1985. ; and
- [8195] Overhauser, J.; Mewar, R.; Rojas, K.; Lia, K.; Kline, A. D.; Silverman, G. A. : STS map of genes and anonymous DNA fragments on human chromosome 18 using a panel of somatic cell hybrids.
- [8196] Further studies establishing the function and utilities of YES1 are found in John Hopkins OMIM database record ID 164880, and in cited publications numbered 3148–3149, 11918–315 and 1694 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926) is another VGAM74 host target gene. ZFP36L1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFP36L1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of ZFP36L1 BINDING SITE, designated SEQ ID:11362, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8197] Another function of VGAM74 is therefore inhibition of Zinc Finger Protein 36, C3H Type-like 1 (ZFP36L1, Accession NM_004926), a gene which is a regulatory protein involved in regulating the response to growth factors. Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFP36L1. The function of ZFP36L1 has been established by previous studies. Bustin et al. (1994) cloned and characterized the ZFP36L1 gene, which they called ERF1, which is a member of the Tis11 family of early-response genes (see OMIM Ref. No. ZFP36; 190700). Members of this gene family contain a distinguishing putative zinc finger domain with a repeating cys-his motif and are induced by various agonists such as the phorbol ester TPA and the polypeptide mitogen EGF (OMIM Ref. No. 131530). The human gene was cloned using a rat homolog as a probe. The rat and human genes have conserved 5-prime and 3-prime UTRs and their promoters

contain motifs seen in other early-response genes. The predicted rat and human proteins are 99% identical. Bustin et al. (1994) determined that the ZFP36L1 gene contains 2 exons and spans about 6 kb of genomic DNA including the promoter and UTRs. Ning et al. (1996) also cloned ZFP36L1, which they termed BERG36 (B-cell early response gene encoding a 36-kD protein). The deduced 338-amino acid BERG36 protein could be induced by treatment with calcium ionophore, and the induction could be blocked by treatment with interleukin-4 (IL4; 147780) but not by CD40 (TNFRSF5; 109535) ligation. Treatment of the Epstein-Barr virus-negative human Burkitt lymphoma cell line Ramos, which phenotypically resembles germinal center B cells, with BERG36-antisense or with IL4 or CD40 ligation protected the cells from ionophore-induced apoptosis. CD40 ligation also protected Ramos cells from apoptosis induced by inhibitors of macromolecular synthesis. Ning et al. (1996) concluded that BERG36 is a target of IL4 signaling for B-cell survival.

[8201] Further studies establishing the function and utilities of ZFP36L1 are found in John Hopkins OMIM database record ID 601064, and in cited publications numbered 7811-7814 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BCL2-associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM74 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11303, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8202] Another function of VGAM74 is therefore inhibition of BCL2-associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956) is another VGAM74 host target gene. C9orf9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C9orf9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf9 BINDING SITE, designated SEQ ID:21028, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8203] Another function of VGAM74 is therefore inhibition of Chromosome 9 Open Reading Frame 9 (C9orf9, Accession NM_018956). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf9. Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444) is another VGAM74 host target gene. CHRAC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by CHRAC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CHRAC1 BINDING SITE, designated SEQ ID:18904, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8204] Another function of VGAM74 is therefore inhibition of Chromatin Accessibility Complex 1 (CHRAC1, Accession NM_017444). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CHRAC1. DKFZP564I122 (Accession XM_032397) is another VGAM74 host target gene. DKFZP564I122 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564I122, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I122 BINDING SITE, designated SEQ ID:31644, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8205] Another function of VGAM74 is therefore inhibition of DK-

FZP564I122 (Accession XM_032397). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DK-FZP564I122. FLJ00024 (Accession XM_033361) is another VGAM74 host target gene. FLJ00024 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ00024, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ00024 BINDING SITE, designated SEQ ID:31892, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8206] Another function of VGAM74 is therefore inhibition of FLJ00024 (Accession XM_033361). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ00024. FLJ10346 (Accession NM_018065) is another VGAM74 host target gene. FLJ10346 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10346, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ10346 BINDING SITE, designated SEQ ID:19837, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8207] Another function of VGAM74 is therefore inhibition of FLJ10346 (Accession NM_018065). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10346. FLJ10535 (Accession NM_018129) is another VGAM74 host target gene. FLJ10535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10535 BINDING SITE, designated SEQ ID:19919, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8208] Another function of VGAM74 is therefore inhibition of FLJ10535 (Accession NM_018129). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10535. FLJ10846 (Accession NM_018241) is another VGAM74

host target gene. FLJ10846 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10846, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10846 BINDING SITE, designated SEQ ID:20199, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8209] Another function of VGAM74 is therefore inhibition of FLJ10846 (Accession NM_018241). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10846. FLJ12572 (Accession NM_022905) is another VGAM74 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23198, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8210] Another function of VGAM74 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ14950 (Accession NM_032865) is another VGAM74 host target gene. FLJ14950 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14950, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14950 BINDING SITE, designated SEQ ID:26673, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8211] Another function of VGAM74 is therefore inhibition of FLJ14950 (Accession NM_032865). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14950. FLJ22002 (Accession NM_024838) is another VGAM74 host target gene. FLJ22002 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22002 BINDING SITE, designated SEQ ID:24246, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8212] Another function of VGAM74 is therefore inhibition of FLJ22002 (Accession NM_024838). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22002. FLJ22531 (Accession NM_024650) is another VGAM74 host target gene. FLJ22531 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22531, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22531 BINDING SITE, designated SEQ ID:23945, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8213] Another function of VGAM74 is therefore inhibition of FLJ22531 (Accession NM_024650). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22531.

FLJ22794 (Accession XM_166220) is another VGAM74 host target gene. FLJ22794 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ22794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22794 BINDING SITE, designated SEQ ID:44028, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8214] Another function of VGAM74 is therefore inhibition of FLJ22794 (Accession XM_166220). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22794. FLJ23053 (Accession NM_022907) is another VGAM74 host target gene. FLJ23053 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23053, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23053 BINDING SITE, designated SEQ ID:23206, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2785.

[8215] Another function of VGAM74 is therefore inhibition of FLJ23053 (Accession NM_022907). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23053. FLJ23392 (Accession NM_024784) is another VGAM74 host target gene. FLJ23392 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23392, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23392 BINDING SITE, designated SEQ ID:24161, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8216] Another function of VGAM74 is therefore inhibition of FLJ23392 (Accession NM_024784). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23392. FLJ23519 (Accession NM_032240) is another VGAM74 host target gene. FLJ23519 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23519, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23519 BINDING SITE, designated SEQ ID:25976, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8217] Another function of VGAM74 is therefore inhibition of FLJ23519 (Accession NM_032240). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23519. FLJ23563 (Accession XM_041701) is another VGAM74 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33563, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8218] Another function of VGAM74 is therefore inhibition of FLJ23563 (Accession XM_041701). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ23563. FLJ25416 (Accession NM_145018) is another VGAM74 host target gene. FLJ25416 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ25416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ25416 BINDING SITE, designated SEQ ID:29625, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8219] Another function of VGAM74 is therefore inhibition of FLJ25416 (Accession NM_145018). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ25416. GAL3ST-4 (Accession NM_024637) is another VGAM74 host target gene. GAL3ST-4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GAL3ST-4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAL3ST-4 BINDING SITE, designated SEQ ID:23911, to the nucleotide se-

quence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8220] Another function of VGAM74 is therefore inhibition of GAL3ST-4 (Accession NM_024637). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAL3ST-4. Golgi Autoantigen, Golgin Subfamily A, 3 (GOLGA3, Accession NM_005895) is another VGAM74 host target gene. GOLGA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GOLGA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA3 BINDING SITE, designated SEQ ID:12514, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8221] Another function of VGAM74 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 3 (GOLGA3, Accession NM_005895). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA3. H-plk (Accession NM_015852) is another VGAM74 host target

gene. H-plk BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by H-plk, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of H-plk BINDING SITE, designated SEQ ID:17985, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8222] Another function of VGAM74 is therefore inhibition of H-plk (Accession NM_015852). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with H-plk. KIAA0426 (Accession NM_014724) is another VGAM74 host target gene. KIAA0426 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0426, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0426 BINDING SITE, designated SEQ ID:16310, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8223] Another function of VGAM74 is therefore inhibition of

KIAA0426 (Accession NM_014724). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0426. KIAA0469 (Accession NM_014851) is another VGAM74 host target gene. KIAA0469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0469 BINDING SITE, designated SEQ ID:16891, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8224] Another function of VGAM74 is therefore inhibition of KIAA0469 (Accession NM_014851). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0469. KIAA0527 (Accession XM_171054) is another VGAM74 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45846, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8225] Another function of VGAM74 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA0561 (Accession XM_038150) is another VGAM74 host target gene. KIAA0561 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0561, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0561 BINDING SITE, designated SEQ ID:32764, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8226] Another function of VGAM74 is therefore inhibition of KIAA0561 (Accession XM_038150). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0561. KIAA0599 (Accession XM_085127) is another

VGAM74 host target gene. KIAA0599 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0599, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0599 BINDING SITE, designated SEQ ID:37856, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8227] Another function of VGAM74 is therefore inhibition of KIAA0599 (Accession XM_085127). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0599. KIAA0841 (Accession XM_049237) is another VGAM74 host target gene. KIAA0841 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0841, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0841 BINDING SITE, designated SEQ ID:35361, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8228] Another function of VGAM74 is therefore inhibition of KIAA0841 (Accession XM_049237). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0841. KIAA1054 (Accession XM_043493) is another VGAM74 host target gene. KIAA1054 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1054, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1054 BINDING SITE, designated SEQ ID:33953, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8229] Another function of VGAM74 is therefore inhibition of KIAA1054 (Accession XM_043493). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1054. KIAA1198 (Accession XM_032674) is another VGAM74 host target gene. KIAA1198 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1198, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1198 BINDING SITE, designated SEQ ID:31708, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8230] Another function of VGAM74 is therefore inhibition of KIAA1198 (Accession XM_032674). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1198. KIAA1373 (Accession XM_048195) is another VGAM74 host target gene. KIAA1373 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1373, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1373 BINDING SITE, designated SEQ ID:35127, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8231] Another function of VGAM74 is therefore inhibition of KIAA1373 (Accession XM_048195). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1373. KIAA1443 (Accession XM_033392) is another VGAM74 host target gene. KIAA1443 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1443, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1443 BINDING SITE, designated SEQ ID:31931, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8232] Another function of VGAM74 is therefore inhibition of KIAA1443 (Accession XM_033392). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1443. KIAA1497 (Accession XM_041431) is another VGAM74 host target gene. KIAA1497 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1497, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1497 BINDING SITE, designated SEQ ID:33528, to the nucleotide sequence of VGAM74 RNA, herein designated

VGAM RNA, also designated SEQ ID:2785.

[8233] Another function of VGAM74 is therefore inhibition of KIAA1497 (Accession XM_041431). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1497. KIAA1615 (Accession XM_044021) is another VGAM74 host target gene. KIAA1615 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1615, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1615 BINDING SITE, designated SEQ ID:34084, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8234] Another function of VGAM74 is therefore inhibition of KIAA1615 (Accession XM_044021). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1615. KIAA1922 (Accession XM_057040) is another VGAM74 host target gene. KIAA1922 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1922, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1922 BINDING SITE, designated SEQ ID:36455, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8235] Another function of VGAM74 is therefore inhibition of KIAA1922 (Accession XM_057040). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1922. KIAA1924 (Accession XM_057091) is another VGAM74 host target gene. KIAA1924 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1924, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1924 BINDING SITE, designated SEQ ID:36475, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8236] Another function of VGAM74 is therefore inhibition of KIAA1924 (Accession XM_057091). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1924. KIAA1971 (Accession XM_058720) is another VGAM74 host target gene. KIAA1971 BINDING SITE1 and KIAA1971 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by KIAA1971, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1971 BINDING SITE1 and KIAA1971 BINDING SITE2, designated SEQ ID:36729 and SEQ ID:36730 respectively, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8237] Another function of VGAM74 is therefore inhibition of KIAA1971 (Accession XM_058720). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1971. Lymphocyte Antigen 75 (LY75, Accession NM_002349) is another VGAM74 host target gene. LY75 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LY75, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of LY75 BINDING SITE, designated SEQ ID:8148, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8238] Another function of VGAM74 is therefore inhibition of Lymphocyte Antigen 75 (LY75, Accession NM_002349). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LY75. Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379) is another VGAM74 host target gene. MAN1C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1C1 BINDING SITE, designated SEQ ID:21645, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8239] Another function of VGAM74 is therefore inhibition of Mannosidase, Alpha, Class 1C, Member 1 (MAN1C1, Accession NM_020379). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and

clinical conditions associated with MAN1C1. MCLC (Accession NM_015127) is another VGAM74 host target gene. MCLC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MCLC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MCLC BINDING SITE, designated SEQ ID:17491, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8240] Another function of VGAM74 is therefore inhibition of MCLC (Accession NM_015127). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MCLC. MGC11115 (Accession NM_032310) is another VGAM74 host target gene. MGC11115 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC11115, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC11115 BINDING SITE, designated SEQ ID:26091, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA,

also designated SEQ ID:2785.

[8241] Another function of VGAM74 is therefore inhibition of MGC11115 (Accession NM_032310). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC11115. MGC15631 (Accession NM_032753) is another VGAM74 host target gene. MGC15631 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC15631, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15631 BINDING SITE, designated SEQ ID:26489, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8242] Another function of VGAM74 is therefore inhibition of MGC15631 (Accession NM_032753). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC15631. MGC35558 (Accession NM_145013) is another VGAM74 host target gene. MGC35558 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC35558, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC35558 BINDING SITE, designated SEQ ID:29611, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8243] Another function of VGAM74 is therefore inhibition of MGC35558 (Accession NM_145013). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC35558. MGC5149 (Accession XM_051200) is another VGAM74 host target gene. MGC5149 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC5149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC5149 BINDING SITE, designated SEQ ID:35784, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8244] Another function of VGAM74 is therefore inhibition of MGC5149 (Accession XM_051200). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC5149. moblak (Accession NM_130807) is another VGAM74 host target gene. moblak BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28308, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8245] Another function of VGAM74 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. Molybdenum Cofactor Synthesis 3 (MOCS3, Accession NM_014484) is another VGAM74 host target gene. MOCS3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MOCS3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MOCS3 BINDING SITE, designated SEQ ID:15830, to the

nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8246] Another function of VGAM74 is therefore inhibition of Molybdenum Cofactor Synthesis 3 (MOCS3, Accession NM_014484). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MOCS3. Phosphoserine Phosphatase (PSPH, Accession NM_004577) is another VGAM74 host target gene. PSPH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PSPH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PSPH BINDING SITE, designated SEQ ID:10924, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8247] Another function of VGAM74 is therefore inhibition of Phosphoserine Phosphatase (PSPH, Accession NM_004577). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PSPH. RAB21, Member RAS Oncogene Family (RAB21, Accession NM_014999) is an-

other VGAM74 host target gene. RAB21 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB21, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB21 BINDING SITE, designated SEQ ID:17367, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8248] Another function of VGAM74 is therefore inhibition of RAB21, Member RAS Oncogene Family (RAB21, Accession NM_014999). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB21. RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296) is another VGAM74 host target gene. RAB33B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB33B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB33B BINDING SITE, designated SEQ ID:25329, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA,

also designated SEQ ID:2785.

[8249] Another function of VGAM74 is therefore inhibition of RAB33B, Member RAS Oncogene Family (RAB33B, Accession NM_031296). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB33B. RAP140 (Accession NM_015224) is another VGAM74 host target gene. RAP140 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAP140, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAP140 BINDING SITE, designated SEQ ID:17557, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8250] Another function of VGAM74 is therefore inhibition of RAP140 (Accession NM_015224). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAP140. RNF9 (Accession NM_052828) is another VGAM74 host target gene. RNF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded

by RNF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RNF9 BINDING SITE, designated SEQ ID:27409, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8251] Another function of VGAM74 is therefore inhibition of RNF9 (Accession NM_052828). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RNF9. STAF65(gamma) (Accession NM_014860) is another VGAM74 host target gene. STAF65(gamma) BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STAF65(gamma), corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STAF65(gamma) BINDING SITE, designated SEQ ID:16924, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8252] Another function of VGAM74 is therefore inhibition of STAF65(gamma) (Accession NM_014860). Accordingly,

utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAF65(gamma). Synaptotagmin XIII (SYT13, Accession XM_167880) is another VGAM74 host target gene. SYT13 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SYT13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYT13 BINDING SITE, designated SEQ ID:44889, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8253] Another function of VGAM74 is therefore inhibition of Synaptotagmin XIII (SYT13, Accession XM_167880). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYT13. TADA3L (Accession NM_133480) is another VGAM74 host target gene. TADA3L BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TADA3L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of TADA3L BINDING SITE, designated SEQ ID:28547, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8254] Another function of VGAM74 is therefore inhibition of TADA3L (Accession NM_133480). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TADA3L. UBF-fl (Accession NM_032828) is another VGAM74 host target gene. UBF-fl BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UBF-fl, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UBF-fl BINDING SITE, designated SEQ ID:26602, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8255] Another function of VGAM74 is therefore inhibition of UBF-fl (Accession NM_032828). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UBF-fl. LOC126661 (Accession XM_059061) is another VGAM74

host target gene. LOC126661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC126661, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126661 BINDING SITE, designated SEQ ID:36851, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8256] Another function of VGAM74 is therefore inhibition of LOC126661 (Accession XM_059061). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126661. LOC128989 (Accession XM_059310) is another VGAM74 host target gene. LOC128989 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC128989, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC128989 BINDING SITE, designated SEQ ID:36943, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8257] Another function of VGAM74 is therefore inhibition of LOC128989 (Accession XM_059310). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC128989. LOC135293 (Accession XM_072402) is another VGAM74 host target gene. LOC135293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37493, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8258] Another function of VGAM74 is therefore inhibition of LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. LOC146784 (Accession XM_085588) is another VGAM74 host target gene. LOC146784 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146784, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146784 BINDING SITE, designated SEQ ID:38238, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8259] Another function of VGAM74 is therefore inhibition of LOC146784 (Accession XM_085588). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146784. LOC146909 (Accession XM_085634) is another VGAM74 host target gene. LOC146909 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146909, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146909 BINDING SITE, designated SEQ ID:38266, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8260] Another function of VGAM74 is therefore inhibition of LOC146909 (Accession XM_085634). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC146909. LOC146952 (Accession XM_097138) is another VGAM74 host target gene. LOC146952 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146952, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146952 BINDING SITE, designated SEQ ID:40767, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8261] Another function of VGAM74 is therefore inhibition of LOC146952 (Accession XM_097138). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146952. LOC147071 (Accession XM_054031) is another VGAM74 host target gene. LOC147071 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147071, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147071 BINDING SITE, designated SEQ ID:36136, to the nucleotide sequence of VGAM74 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2785.

[8262] Another function of VGAM74 is therefore inhibition of LOC147071 (Accession XM_054031). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147071. LOC147694 (Accession XM_085843) is another VGAM74 host target gene. LOC147694 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147694, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147694 BINDING SITE, designated SEQ ID:38372, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8263] Another function of VGAM74 is therefore inhibition of LOC147694 (Accession XM_085843). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147694. LOC147817 (Accession XM_085903) is another VGAM74 host target gene. LOC147817 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147817, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147817 BINDING SITE, designated SEQ ID:38385, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8264] Another function of VGAM74 is therefore inhibition of LOC147817 (Accession XM_085903). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147817. LOC149821 (Accession XM_097751) is another VGAM74 host target gene. LOC149821 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149821, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149821 BINDING SITE, designated SEQ ID:41109, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8265] Another function of VGAM74 is therefore inhibition of LOC149821 (Accession XM_097751). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC149821. LOC151475 (Accession XM_098063) is another VGAM74 host target gene. LOC151475 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC151475, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151475 BINDING SITE, designated SEQ ID:41356, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8266] Another function of VGAM74 is therefore inhibition of LOC151475 (Accession XM_098063). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151475. LOC152300 (Accession XM_087432) is another VGAM74 host target gene. LOC152300 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC152300, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152300 BINDING SITE, designated SEQ ID:39251, to

the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8267] Another function of VGAM74 is therefore inhibition of LOC152300 (Accession XM_087432). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152300. LOC152794 (Accession XM_087525) is another VGAM74 host target gene. LOC152794 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152794, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152794 BINDING SITE, designated SEQ ID:39320, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8268] Another function of VGAM74 is therefore inhibition of LOC152794 (Accession XM_087525). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152794. LOC153579 (Accession XM_087714) is another VGAM74 host target gene. LOC153579 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC153579, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153579 BINDING SITE, designated SEQ ID:39404, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8269] Another function of VGAM74 is therefore inhibition of LOC153579 (Accession XM_087714). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153579. LOC153811 (Accession XM_087779) is another VGAM74 host target gene. LOC153811 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153811, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153811 BINDING SITE, designated SEQ ID:39416, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8270] Another function of VGAM74 is therefore inhibition of LOC153811 (Accession XM_087779). Accordingly, utilities

of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153811. LOC154282 (Accession XM_098505) is another VGAM74 host target gene. LOC154282 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC154282, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154282 BINDING SITE, designated SEQ ID:41699, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8271] Another function of VGAM74 is therefore inhibition of LOC154282 (Accession XM_098505). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC154282. LOC157798 (Accession XM_098827) is another VGAM74 host target gene. LOC157798 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC157798, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC157798 BINDING SITE, designated SEQ ID:41848, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8272] Another function of VGAM74 is therefore inhibition of LOC157798 (Accession XM_098827). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157798. LOC196047 (Accession XM_116883) is another VGAM74 host target gene. LOC196047 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC196047, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196047 BINDING SITE, designated SEQ ID:43144, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8273] Another function of VGAM74 is therefore inhibition of LOC196047 (Accession XM_116883). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196047. LOC200339 (Accession XM_117226) is another VGAM74 host target gene. LOC200339 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200339, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200339 BINDING SITE, designated SEQ ID:43298, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8274] Another function of VGAM74 is therefore inhibition of LOC200339 (Accession XM_117226). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200339. LOC200860 (Accession XM_117289) is another VGAM74 host target gene. LOC200860 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC200860, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200860 BINDING SITE, designated SEQ ID:43354, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8275] Another function of VGAM74 is therefore inhibition of

LOC200860 (Accession XM_117289). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200860. LOC201173 (Accession XM_113312) is another VGAM74 host target gene. LOC201173 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201173 BINDING SITE, designated SEQ ID:42215, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8276] Another function of VGAM74 is therefore inhibition of LOC201173 (Accession XM_113312). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201173. LOC201220 (Accession XM_113321) is another VGAM74 host target gene. LOC201220 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC201220, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC201220 BINDING SITE, designated SEQ ID:42222, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8277] Another function of VGAM74 is therefore inhibition of LOC201220 (Accession XM_113321). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201220. LOC201411 (Accession XM_031946) is another VGAM74 host target gene. LOC201411 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201411 BINDING SITE, designated SEQ ID:31528, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8278] Another function of VGAM74 is therefore inhibition of LOC201411 (Accession XM_031946). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC201411. LOC202025 (Accession XM_117353) is an-

other VGAM74 host target gene. LOC202025 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC202025, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC202025 BINDING SITE, designated SEQ ID:43402, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8279] Another function of VGAM74 is therefore inhibition of LOC202025 (Accession XM_117353). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC202025. LOC203297 (Accession XM_059986) is another VGAM74 host target gene. LOC203297 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC203297, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203297 BINDING SITE, designated SEQ ID:37136, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8280] Another function of VGAM74 is therefore inhibition of LOC203297 (Accession XM_059986). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203297. LOC203350 (Accession XM_117536) is another VGAM74 host target gene. LOC203350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203350 BINDING SITE, designated SEQ ID:43534, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8281] Another function of VGAM74 is therefore inhibition of LOC203350 (Accession XM_117536). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203350. LOC219735 (Accession XM_167601) is another VGAM74 host target gene. LOC219735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219735, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219735 BINDING SITE, designated SEQ ID:44720, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8282] Another function of VGAM74 is therefore inhibition of LOC219735 (Accession XM_167601). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219735. LOC221463 (Accession XM_166374) is another VGAM74 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44203, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8283] Another function of VGAM74 is therefore inhibition of LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221463. LOC222070 (Accession XM_168433) is another VGAM74 host target gene. LOC222070 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222070, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222070 BINDING SITE, designated SEQ ID:45181, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8284] Another function of VGAM74 is therefore inhibition of LOC222070 (Accession XM_168433). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222070. LOC253666 (Accession XM_170799) is another VGAM74 host target gene. LOC253666 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC253666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253666 BINDING SITE, designated SEQ ID:45568, to the nucleotide sequence of VGAM74 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2785.

[8285] Another function of VGAM74 is therefore inhibition of LOC253666 (Accession XM_170799). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253666. LOC256360 (Accession XM_172918) is another VGAM74 host target gene. LOC256360 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC256360, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256360 BINDING SITE, designated SEQ ID:46175, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8286] Another function of VGAM74 is therefore inhibition of LOC256360 (Accession XM_172918). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256360. LOC90371 (Accession XM_031261) is another VGAM74 host target gene. LOC90371 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90371, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90371 BINDING SITE, designated SEQ ID:31321, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8287] Another function of VGAM74 is therefore inhibition of LOC90371 (Accession XM_031261). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90371. LOC91115 (Accession XM_036218) is another VGAM74 host target gene. LOC91115 BINDING SITE1 and LOC91115 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by LOC91115, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91115 BINDING SITE1 and LOC91115 BINDING SITE2, designated SEQ ID:32396 and SEQ ID:32395 respectively, to the nucleotide sequence of VGAM74 RNA, herein designated VGAM RNA, also designated SEQ ID:2785.

[8288] Another function of VGAM74 is therefore inhibition of

LOC91115 (Accession XM_036218). Accordingly, utilities of VGAM74 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91115. CD164 Antigen, Sialomucin (CD164, Accession NM_006016) is another VGAM75 host target gene. CD164 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CD164, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD164 BINDING SITE, designated SEQ ID:12631, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8289] Another function of VGAM75 is therefore inhibition of CD164 Antigen, Sialomucin (CD164, Accession NM_006016), a gene which plays a role in hematopoiesis by facilitating the adhesion of CD34+ cells to bone marrow stroma and negatively regulates CD34+ hematopoietic progenitor cell growth. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD164. The function of CD164 has been established by previous

studies. The sialomucins appear to play 2 key but opposing roles in vivo: the first as cytoprotective or antiadhesive agents, and the second as adhesion receptors. Despite their common functions, these mucins encompass a heterogeneous group of secreted or membrane-associated proteins. Using 2 monoclonal antibodies and a retroviral expression cloning strategy, Zannettino et al. (1998) isolated a cDNA encoding a novel transmembrane isoform of the mucin-like glycoprotein MGC-24, which they designated CD164. The mature CD164 protein contains 178 amino acids, has a molecular mass of 80 to 90 kD, and is extremely rich in serine and threonine. CD164 is expressed by human CD34+ (OMIM Ref. No. 142230) hematopoietic progenitor cells. Zannettino et al. (1998) found that the CD164 receptor appears to play a role in hematopoiesis by facilitating the adhesion of CD34+ cells to bone marrow stroma and by negatively regulating CD34+ hematopoietic progenitor cell growth. They found that these functional effects are mediated by at least 2 spatially distinct epitopes, defined by specific monoclonal antibodies. Watt et al. (1998) showed that these and other CD164 monoclonal antibodies show distinct patterns of reactivity when analyzed on hematopoietic cells from nor-

mal human bone marrow, umbilical cord blood, and peripheral blood. Expression of the CD164 epitope was found on developing myelomonocytic cells in bone marrow, being downregulated on mature neutrophils but maintained on monocytes in the peripheral blood. Watt et al. (1998) extended these studies further to identify PAC clones containing the CD164 gene and used the clone to localize the CD164 gene specifically to 6q21 by fluorescence in situ hybridization.

[8290] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8291] Watt, S. M.; Buhring, H.-J.; Rappold, I.; Chan, J. Y.-H.; Lee-Prudhoe, J.; Jones, T.; Zannettino, A. C. W.; Simmons, P. J.; Doyonnas, R.; Sheer, D.; Butler, L. H. : CD164, a novel sialomucin on CD34+ and erythroid subsets, is located on human chromosome 6q21. Blood 92: 849-866, 1998. ; and

[8292] Zannettino, A. C. W.; Buhring, H.-J.; Niutta, S.; Watt, S. M.; Benton, M. A.; Simmons, P. J. : The sialomucin CD164 (MGC-24v) is an adhesive glycoprotein expressed by human hematopoietic.

[8293] Further studies establishing the function and utilities of

CD164 are found in John Hopkins OMIM database record ID 603356, and in cited publications numbered 1090–1091 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033018) is another VGAM75 host target gene. PCTK1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PCTK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PCTK1 BINDING SITE, designated SEQ ID:26909, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8294] Another function of VGAM75 is therefore inhibition of PCTAIRE Protein Kinase 1 (PCTK1, Accession NM_033018), a gene which may play a role in signal transduction cascades in terminally differentiated cells. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCTK1. The function of PCTK1 has been established by previous studies. The mechanisms that govern the progression through the eukaryotic cell cycle consist of mul-

multiple regulatory processes that control discrete transition points, such as the G₀/G₁ and G₁/S transitions and the entry into mitosis. One of the key components regulating the initiation and passage through mitosis is the serine/threonine-specific protein kinase, p34(cdc2/CDC28); see 116953. There exists an extended gene family encoding a large number of different cdc2-related serine/threonine-specific protein kinases. The PCTAIRE protein kinases comprise a distinct subfamily of these kinases and are so named for the presence of a cysteine-for-serine substitution in the conserved PSTAIRE amino acid motif found in prototypic cdc2 kinases. Three members of this kinase subfamily, PCTAIRE 1–3, were identified in humans (Meyerson et al., 1992), whereas only 2 members were identified in mice, PCTAIRE1 and –3 (Okuda et al., 1992). The 3 PCTAIRE kinases are 65% identical to one another (80% within the catalytic domain). PCTAIRE1 is ubiquitously expressed with the highest levels detected in the brain and testis. Human PCTAIRE cDNAs do not complement yeast cdc28 mutants and show other differences, suggesting that PCTAIRE kinases have different cellular functions from those described for CDC2 (OMIM Ref. No. 116940). By screening a human genomic library with

murine PCTAIRE cDNA probes, Okuda et al. (1994) isolated human cosmid clones for the PCTK1 and PCTK3 genes. Using these as probes for fluorescence in situ hybridization analyses, they showed that PCTK1 and PCTK3 are located on bands Xp11 and 1q31-q32, respectively. Knight et al. (1995) found that PCTK1 maps distal to the t(X;18) synovial sarcoma breakpoint in Xp11.23. A 420-kb YAC clone positive for PCTK1 also contained the gene coding for ubiquitin-activating enzyme UBE1 (OMIM Ref. No. 314370), previously mapped to Xp11.3.

- [8296] Okuda, T.; Cleveland, J. L.; Downing, J. R. : PCTAIRE-1 and PCTAIRE-3, two members of a novel cdc2/CDC28-related protein kinase gene family. *Oncogene* 7: 2249-2258, 1992. ; and
- [8297] Okuda, T.; Valentine, V. A.; Shapiro, D. N.; Downing, J. R. : Cloning of genomic loci and chromosomal localization of the human PCTAIRE-1 and -3 protein kinase genes. *Genomics* 21: 217-22.
- [8298] Further studies establishing the function and utilities of PCTK1 are found in John Hopkins OMIM database record

ID 311550, and in cited publications numbered 1064 and 3501–3502 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Accession NM_021111) is another VGAM75 host target gene. RECK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RECK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECK BINDING SITE, designated SEQ ID:22090, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8299] Another function of VGAM75 is therefore inhibition of Reversion-inducing-cysteine-rich Protein with Kazal Motifs (RECK, Accession NM_021111), a gene which plays a role in regulation of cancer progression and tumor angiogenesis. Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECK. The function of RECK has been established by previous studies. Transformed malignant cell lines frequently lose a flat morphology and ac-

quire a round morphology. Genes that induce flat reversion may be useful in the control of cancer. By screening a fibroblast expression library for reversion-inducing cDNAs, Takahashi et al. (1998) isolated a cDNA encoding RECK (reversion-inducing, cysteine-rich protein with Kazal motifs). Sequence analysis predicted that the 971-amino acid RECK protein, which shares 93% amino acid identity with mouse Reck, is 9% cysteine and contains an N-terminal signal sequence; 5 putative cysteine knot motifs; 5 potential N-glycosylation sites; 3 central serine protease inhibitor domains with either complete or incomplete Kazal-type, 4-cys motifs; 2 regions with weak homology to EGF-like repeats; and a C-terminal hydrophobic glycosylphosphatidylinositol-anchoring signal. Immunoblot analysis showed that RECK is expressed as a 110-kD protein that is reduced to approximately 100 kD after deglycosylation. Northern blot analysis detected a 4.6-kb RECK transcript in a wide variety of tissues and normal cell lines, but no expression was detected in tumor cell lines. Restoration of RECK expression in tumor cell lines did not affect growth but did significantly suppress matrix invasion and metastatic activity. SDS-PAGE and gelatin zymography analysis demonstrated that due to a posttran-

scriptional event(s), secretion of MMP9 (OMIM Ref. No. 120361), a key enzyme in tumor invasion and metastasis, is decreased in cells expressing RECK. An RECK mutant lacking the C-terminal 23 residues retained the ability to suppress tumor cell invasion and MMP9 proteolytic activity but lost the ability to inhibit MMP9 release. Animal model experiments lend further support to the function of RECK. Oh et al. (2001) showed that in addition to MMP9, RECK also regulates MMP2 (OMIM Ref. No. 120360) and MT1-MMP (MMP14; 600754), which are known to be involved in cancer progression. Mice lacking a functional Reck gene died around embryonic day 10.5 with defects in collagen fibrils, the basal lamina, and vascular development; this phenotype could be partially suppressed by Mmp2 null mutation. Vascular sprouting was dramatically suppressed in tumors derived from Reck-expressing fibrosarcoma cells grown in nude mice. These results supported a role for RECK in the regulation of MMP2 in vivo and implicated RECK downregulation in tumor angiogenesis.

[8300] It is appreciated that the abovementioned animal model for RECK is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appre-

ciated from the publications sited hereinbelow.

- [8301] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8302] Takahashi, C.; Sheng, Z.; Horan, T. P.; Kitayama, H.; Maki, M.; Hitomi, K.; Kitaura, Y.; Takai, S.; Sasahara, R. M.; Hori-moto, A.; Ikawa, Y.; Ratzkin, B. J.; Arakawa, T.; Noda, M. : Regulation of matrix metalloproteinase-9 and inhibition of tumor invasion by the membrane-anchored glycoprotein RECK. Proc. Nat. Acad. Sci. 95: 13221-13226, 1998. ; and
- [8303] Oh, J.; Takahashi, R.; Kondo, S.; Mizoguchi, A.; Adachi, E.; Sasahara, R. M.; Nishimura, S.; Imamura, Y.; Kitayama, H.; Alexander, D. B.; Ide, C.; Horan, T. P.; Arakawa, T.; Yoshida, H.
- [8304] Further studies establishing the function and utilities of RECK are found in John Hopkins OMIM database record ID 605227, and in sited publications numbered 7306-7307 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tryptophan Rich Basic Protein (WRB, Accession NM_004627) is another VGAM75 host target gene. WRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region

of mRNA encoded by WRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WRB BINDING SITE, designated SEQ ID:10998, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8305] Another function of VGAM75 is therefore inhibition of Tryptophan Rich Basic Protein (WRB, Accession NM_004627). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WRB. ATPase, H⁺ Transporting, Lysosomal 34kDa, V1 Subunit D (ATP6V1D, Accession NM_015994) is another VGAM75 host target gene. ATP6V1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP6V1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP6V1D BINDING SITE, designated SEQ ID:18087, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8306] Another function of VGAM75 is therefore inhibition of ATPase, H⁺ Transporting, Lysosomal 34kDa, V1 Subunit D (ATP6V1D, Accession NM_015994). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP6V1D. DNAM-1 (Accession NM_006566) is another VGAM75 host target gene. DNAM-1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DNAM-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DNAM-1 BINDING SITE, designated SEQ ID:13337, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8307] Another function of VGAM75 is therefore inhibition of DNAM-1 (Accession NM_006566). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DNAM-1. FLJ20281 (Accession XM_165663) is another VGAM75 host target gene. FLJ20281 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20281, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20281 BINDING SITE, designated SEQ ID:43727, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8308] Another function of VGAM75 is therefore inhibition of FLJ20281 (Accession XM_165663). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20281. Golgi Associated, Gamma Adaptin Ear Containing, ARF Binding Protein 2 (GGA2, Accession NM_138640) is another VGAM75 host target gene. GGA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GGA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GGA2 BINDING SITE, designated SEQ ID:28919, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8309] Another function of VGAM75 is therefore inhibition of Golgi Associated, Gamma Adaptin Ear Containing, ARF

Binding Protein 2 (GGA2, Accession NM_138640). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GGA2. KIAA1388 (Accession XM_168030) is another VGAM75 host target gene. KIAA1388 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1388, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1388 BINDING SITE, designated SEQ ID:44950, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8310] Another function of VGAM75 is therefore inhibition of KIAA1388 (Accession XM_168030). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1388. Protocadherin 20 (PCDH20, Accession NM_022843) is another VGAM75 host target gene. PCDH20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PCDH20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of PCDH20 BINDING SITE, designated SEQ ID:23136, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8311] Another function of VGAM75 is therefore inhibition of Protocadherin 20 (PCDH20, Accession NM_022843). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PCDH20. Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823) is another VGAM75 host target gene. STK38L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by STK38L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STK38L BINDING SITE, designated SEQ ID:34294, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8312] Another function of VGAM75 is therefore inhibition of Serine/threonine Kinase 38 Like (STK38L, Accession XM_044823). Accordingly, utilities of VGAM75 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with STK38L. ZER6 (Accession XM_032742) is another VGAM75 host target gene. ZER6 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ZER6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZER6 BINDING SITE, designated SEQ ID:31748, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8313] Another function of VGAM75 is therefore inhibition of ZER6 (Accession XM_032742). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZER6. LOC144893 (Accession XM_096687) is another VGAM75 host target gene. LOC144893 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144893, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144893 BINDING SITE, designated SEQ ID:40456, to the nucleotide se-

quence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8314] Another function of VGAM75 is therefore inhibition of LOC144893 (Accession XM_096687). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144893. LOC146515 (Accession XM_085493) is another VGAM75 host target gene. LOC146515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146515 BINDING SITE, designated SEQ ID:38193, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8315] Another function of VGAM75 is therefore inhibition of LOC146515 (Accession XM_085493). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. LOC151877 (Accession XM_098132) is another VGAM75 host target gene. LOC151877 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC151877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151877 BINDING SITE, designated SEQ ID:41395, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8316] Another function of VGAM75 is therefore inhibition of LOC151877 (Accession XM_098132). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151877. LOC56899 (Accession NM_020140) is another VGAM75 host target gene. LOC56899 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC56899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC56899 BINDING SITE, designated SEQ ID:21335, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8317] Another function of VGAM75 is therefore inhibition of LOC56899 (Accession NM_020140). Accordingly, utilities

of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC56899. LOC90161 (Accession XM_029551) is another VGAM75 host target gene. LOC90161 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90161, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90161 BINDING SITE, designated SEQ ID:30902, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8318] Another function of VGAM75 is therefore inhibition of LOC90161 (Accession XM_029551). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90161. LOC90538 (Accession XM_032401) is another VGAM75 host target gene. LOC90538 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90538, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC90538 BINDING SITE, designated SEQ ID:31655, to the nucleotide sequence of VGAM75 RNA, herein designated VGAM RNA, also designated SEQ ID:2786.

[8319] Another function of VGAM75 is therefore inhibition of LOC90538 (Accession XM_032401). Accordingly, utilities of VGAM75 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90538. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 76 (VGAM76) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8320] VGAM76 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM76 was detected is described hereinabove with reference to Figs. 1–8.

[8321] VGAM76 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Murine Adenovirus A. VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8322] VGAM76 gene encodes a VGAM76 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM76 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM76 precursor RNA is designated SEQ ID:62, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:62 is located at position 2296 relative to the genome of Murine Adenovirus A.

[8323] VGAM76 precursor RNA folds onto itself, forming VGAM76 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8324] An enzyme complex designated DICER COMPLEX, `dices` the VGAM76 folded precursor RNA into VGAM76 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a

hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 73%) nucleotide sequence of VGAM76 RNA is designated SEQ ID:2787, and is provided hereinbelow with reference to the sequence listing part.

[8325] VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM76 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8326] VGAM76 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM76 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration,

Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM76 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8327] The complementary binding of VGAM76 RNA, herein designated VGAM RNA, to host target binding sites on VGAM76 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM76 host target RNA into VGAM76 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8328] It is appreciated that VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM76 host target genes. The mRNA of each one of this plurality of VGAM76 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM76 RNA, herein designated VGAM RNA, and which when bound by VGAM76 RNA causes inhibition of translation of respective one or more VGAM76 host target proteins.

[8329] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM76 gene, herein designated VGAM GENE, on one or more VGAM76 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective:

Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8330] It is yet further appreciated that a function of VGAM76 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of viral infection by Murine Adenovirus A. Specific functions, and accordingly utilities, of VGAM76 correlate with, and may be deduced from, the identity of the host target genes which VGAM76 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8331] Nucleotide sequences of the VGAM76 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM76 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM76 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM76 are further described hereinbelow with reference to Table 1.

[8332] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM76 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM76 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[8333] As mentioned hereinabove with reference to Fig. 1, a function of VGAM76 gene, herein designated VGAM is inhibition of expression of VGAM76 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM76 correlate with, and may be deduced from, the identity of the target genes which VGAM76 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8334] Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223) is a VGAM76 host target gene. ITPR2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR2 BINDING SITE, designated SEQ ID:7989, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8335] A function of VGAM76 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 2 (ITPR2, Accession NM_002223). Accordingly, utilities of VGAM76 include di-

agnosis, prevention and treatment of diseases and clinical conditions associated with ITPR2. TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619) is another VGAM76 host target gene. TRAF5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TRAF5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRAF5 BINDING SITE, designated SEQ ID:10964, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8336] Another function of VGAM76 is therefore inhibition of TNF Receptor-associated Factor 5 (TRAF5, Accession NM_004619), a gene which Member of a family of proteins that interact with TNF receptors; binds the lymphotoxin beta receptor (LTBR). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRAF5. The function of TRAF5 has been established by previous studies. Tumor necrosis factor (TNF; 191160) receptor-associated factors (TRAFs) are signal transducers for members of the TNF receptor superfamily (see OMIM Ref. No. 191190). TRAF

proteins are composed of an N-terminal cysteine/histidine-rich region containing zinc RING and/or zinc finger motifs, a coiled coil (leucine zipper) motif, and a homologous region in the C terminus that defines the TRAF family, the TRAF domain. The TRAF domain is involved in self-association and receptor binding. By degenerative oligonucleotide PCR amplification, Nakano et al. (1996) identified TRAF5 in the mouse and showed that it specifically interacts with the lymphotoxin-beta receptor (OMIM Ref. No. 600979) and activates the transcription factor NF-kappa-B (see OMIM Ref. No. 164011). Nakano et al. (1997) cloned the human TRAF homolog by cross hybridization with mouse TRAF5 cDNA. Their human cDNA of 2,894 bp has a 557-amino acid open reading frame that exhibits 77.5 and 80% identity to mouse TRAF5 at the nucleotide and amino acid levels, respectively. Northern blot analysis revealed that human TRAF5 mRNA is expressed in all visceral organs. Western blotting revealed that the human protein is abundantly expressed in a human follicular dendritic cell line, and to a lesser degree in several tumor cell lines. By in vitro binding, immunoprecipitation, immunoblot, and yeast 2-hybrid analyses, Aizawa et al. (1997) showed that TRAF2 (OMIM Ref. No.

601895) and TRAF5 interact with overlapping but distinct sequences in the C-terminal region of CD30 (OMIM Ref. No. 153243) and mediate the activation of NF κ B. By inter-specific backcross mapping, Nakano et al. (1997) showed that Traf5 is located in the distal region of mouse chromosome 1, which shares homology with human 1q. Fluorescence in situ hybridization confirmed the regional localization of human TRAF5 to chromosome 1q32. To investigate the functional role of Traf5 in vivo, Nakano et al. (1999) generated Traf5-deficient mice by gene targeting. They found that Traf5 $-/-$ B lymphocytes show defects in proliferation and upregulation of various surface molecules, including CD23 (OMIM Ref. No. 151445), CD54 (OMIM Ref. No. 147840), CD80 (OMIM Ref. No. 112203), CD86 (OMIM Ref. No. 601020), and FAS (OMIM Ref. No. 134637) in response to CD40 (OMIM Ref. No. 109535) stimulation. Moreover, in vitro Ig production by Traf5 $-/-$ T lymphocytes stimulated with anti-CD40 plus IL4 (OMIM Ref. No. 147780) was reduced substantially. CD27-mediated costimulatory signal also was impaired in Traf5 $-/-$ T lymphocytes. Collectively, these results demonstrated that Traf5 is involved in CD40- and CD27-mediated signaling.

- [8337] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8338] Nakano, H.; Sakon, S.; Koseki, H.; Takemori, T.; Tada, K.; Matsumoto, M.; Munechika, E.; Sakai, T.; Shirasawa, T.; Akiba, H.; Kobata, T.; Santee, S. M.; Ware, C. F.; Renner, P. D.; Taniguchi, M.; Yagita, H.; Okumura, K. : Targeted disruption of Traf5 gene causes defects in CD40- and CD27-mediated lymphocyte activation. Proc. Nat. Acad. Sci. 96: 9803-9808, 1999. ; and

- [8340] Further studies establishing the function and utilities of TRAF5 are found in John Hopkins OMIM database record ID 602356, and in cited publications numbered 11509-9025 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ20296 (Accession NM_017750) is another VGAM76 host target gene. FLJ20296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20296, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20296 BINDING SITE, designated SEQ ID:19356, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8341] Another function of VGAM76 is therefore inhibition of FLJ20296 (Accession NM_017750). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20296. KIAA0574 (Accession XM_045076) is another VGAM76 host target gene. KIAA0574 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0574, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0574 BINDING SITE, designated SEQ ID:34347, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8342] Another function of VGAM76 is therefore inhibition of KIAA0574 (Accession XM_045076). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA0574. LOC145719 (Accession XM_096848) is another VGAM76 host target gene. LOC145719 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145719, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145719 BINDING SITE, designated SEQ ID:40578, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8343] Another function of VGAM76 is therefore inhibition of LOC145719 (Accession XM_096848). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145719. LOC145720 (Accession XM_096846) is another VGAM76 host target gene. LOC145720 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC145720, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145720 BINDING SITE, designated SEQ ID:40567, to

the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8344] Another function of VGAM76 is therefore inhibition of LOC145720 (Accession XM_096846). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145720. LOC197114 (Accession XM_116987) is another VGAM76 host target gene. LOC197114 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC197114, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197114 BINDING SITE, designated SEQ ID:43190, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8345] Another function of VGAM76 is therefore inhibition of LOC197114 (Accession XM_116987). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197114. LOC197117 (Accession XM_116989) is another VGAM76 host target gene. LOC197117 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC197117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC197117 BINDING SITE, designated SEQ ID:43197, to the nucleotide sequence of VGAM76 RNA, herein designated VGAM RNA, also designated SEQ ID:2787.

[8346] Another function of VGAM76 is therefore inhibition of LOC197117 (Accession XM_116989). Accordingly, utilities of VGAM76 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC197117. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 77 (VGAM77) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8347] VGAM77 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM77 was detected is described hereinabove with reference to Figs. 1–8.

[8348] VGAM77 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Murine Adenovirus A. VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8349] VGAM77 gene encodes a VGAM77 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM77 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM77 precursor RNA is designated SEQ ID:63, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:63 is located at position 1609 relative to the genome of Murine Adenovirus A.

[8350] VGAM77 precursor RNA folds onto itself, forming VGAM77 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8351] An enzyme complex designated DICER COMPLEX, `dices` the VGAM77 folded precursor RNA into VGAM77 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM77 RNA is designated SEQ ID:2788, and is provided hereinbelow with reference to the sequence listing part.

[8352] VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM77 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8353] VGAM77 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM77 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM77 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8354] The complementary binding of VGAM77 RNA, herein designated VGAM RNA, to host target binding sites on VGAM77 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM77 host target RNA into VGAM77 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8355] It is appreciated that VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM77 host target genes. The mRNA of each one of this plurality of VGAM77 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM77 RNA, herein designated VGAM RNA, and which when bound by VGAM77 RNA causes inhibition of translation of respective one or more VGAM77 host target proteins.

[8356] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM77 gene, herein designated VGAM GENE, on one or more VGAM77 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8357] It is yet further appreciated that a function of VGAM77 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of viral infection by Murine Adenovirus A. Specific functions, and accordingly utilities, of VGAM77 correlate with, and may be deduced from, the identity of the host target genes which VGAM77 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8358] Nucleotide sequences of the VGAM77 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM77 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM77 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM77 are further described hereinbelow with reference to Table 1.

[8359] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM77 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM77 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8360] As mentioned hereinabove with reference to Fig. 1, a function of VGAM77 gene, herein designated VGAM is inhibition of expression of VGAM77 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM77 correlate with, and may be deduced from, the identity of the target genes which VGAM77 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8361] Polymerase (DNA directed), Epsilon 3 (p17 subunit) (POLE3, Accession NM_017443) is a VGAM77 host target gene. POLE3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POLE3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POLE3 BINDING SITE, designated SEQ ID:18900, to the nucleotide sequence of VGAM77 RNA,

herein designated VGAM RNA, also designated SEQ ID:2788.

[8362] A function of VGAM77 is therefore inhibition of Polymerase (DNA directed), Epsilon 3 (p17 subunit) (POLE3, Accession NM_017443). Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POLE3. Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815) is another VGAM77 host target gene. SLC5A7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC5A7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC5A7 BINDING SITE, designated SEQ ID:22390, to the nucleotide sequence of VGAM77 RNA, herein designated VGAM RNA, also designated SEQ ID:2788.

[8363] Another function of VGAM77 is therefore inhibition of Solute Carrier Family 5 (choline transporter), Member 7 (SLC5A7, Accession NM_021815). Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC5A7.

LOC120939 (Accession XM_073688) is another VGAM77 host target gene. LOC120939 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC120939, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC120939 BINDING SITE, designated SEQ ID:37511, to the nucleotide sequence of VGAM77 RNA, herein designated VGAM RNA, also designated SEQ ID:2788.

[8364] Another function of VGAM77 is therefore inhibition of LOC120939 (Accession XM_073688). Accordingly, utilities of VGAM77 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC120939. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 78 (VGAM78) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8365] VGAM78 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM78 was detected is described hereinabove with reference to Figs. 1–8.

[8366] VGAM78 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8367] VGAM78 gene encodes a VGAM78 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM78 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM78 precursor RNA is designated SEQ ID:64, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:64 is located at position 14370 relative to the genome of Plutella Xylostella Granulovirus.

[8368] VGAM78 precursor RNA folds onto itself, forming VGAM78 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first

half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8369] An enzyme complex designated DICER COMPLEX, `dices` the VGAM78 folded precursor RNA into VGAM78 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM78 RNA is designated SEQ ID:2789, and is provided hereinbelow with reference to the sequence listing part.

[8370] VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM78 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8371] VGAM78 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM78 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM78 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM78 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8372] The complementary binding of VGAM78 RNA, herein designated VGAM RNA, to host target binding sites on VGAM78 host target RNA, herein designated VGAM HOST

TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM78 host target RNA into VGAM78 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8373] It is appreciated that VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM78 host target genes. The mRNA of each one of this plurality of VGAM78 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM78 RNA, herein designated VGAM RNA, and which when bound by VGAM78 RNA causes inhibition of translation of respective one or more VGAM78 host target proteins.

[8374] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM78 gene, herein designated VGAM GENE, on one or more VGAM78 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific

complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8375] It is yet further appreciated that a function of VGAM78 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM78 correlate with, and may be deduced from, the identity of the host target genes which VGAM78 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8376] Nucleotide sequences of the VGAM78 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM78 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM78 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, of VGAM78 are further described hereinbelow with reference to Table 1.

[8377] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM78 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM78 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8378] As mentioned hereinabove with reference to Fig. 1, a function of VGAM78 gene, herein designated VGAM is inhibition of expression of VGAM78 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM78 correlate with, and may be deduced from, the identity of the target genes which VGAM78 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8379] C1D (Accession NM_006333) is a VGAM78 host target gene. C1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of C1D BINDING SITE, designated SEQ ID:13032, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:2789.

[8380] A function of VGAM78 is therefore inhibition of C1D (Accession NM_006333), a gene which is similar to murine C1D and may be a component of nuclear hormone receptor complexes. Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1D. The function of C1D has been established by previous studies. Using RevErb (see OMIM Ref. No. 602408) as bait in a yeast 2-hybrid screen to identify nuclear hormone receptor corepressors, Zamir et al. (1997) cloned mouse C1d, which they called Sun-Cor, from a 17-day mouse embryo library. Sun-Cor encodes a highly basic 141-amino acid protein with a molecular mass of 16 kD. Northern blot analysis revealed expression of a 1.2-kb transcript in all 9 mouse tissues tested. Immunolocalization of Sun-Cor within transfected human kidney cells revealed a nuclear distribution. Zamir et al. (1997) determined that Sun-Cor potentiates transcriptional repression by thyroid hormone receptor and RevErb in vivo, represses transcription when fused to a heterologous DNA-binding domain, and interacts with Re-

vErb as well as with the thyroid hormone receptor in vitro. Sun-Cor also interacts with N-Cor (OMIM Ref. No. 600849) and Smrt (OMIM Ref. No. 500848) in vitro and with endogenous N-Cor in cultured cells. Zamir et al. (1997) also determined that Sun-Cor message and protein levels increase with differentiation of preadipocytes and myocytes in culture. Through mutation analysis, transfection, and expression of truncated message, they mapped the repression domain to the N-terminus. By cotransfection of RevErb and Sun-Cor followed by immunoprecipitation, direct interaction between these proteins was established. Similarly, they established direct interaction between Sun-Cor and N-Cor.

[8381] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8382] Zamir, I.; Dawson, J.; Lavinsky, R. M.; Glass, C. K.; Rosenfeld, M. G.; Lazar, M. A. : Cloning and characterization of a corepressor and potential component of the nuclear hormone receptor repression complex. Proc. Nat. Acad. Sci. 94: 14400-14405, 1997. ; and

[8383] Nehls, P.; Keck, T.; Greferath, R.; Spiess, E.; Glaser, T.; Rothbarth, K.; Stammer, H.; Werner, D. : cDNA cloning, re-

combinant expression and characterization of polypeptides with except.

[8384] Further studies establishing the function and utilities of C1D are found in John Hopkins OMIM database record ID 606997, and in cited publications numbered 5161–5164 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257) is another VGAM78 host target gene. C20orf142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf142 BINDING SITE, designated SEQ ID:36932, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:2789.

[8385] Another function of VGAM78 is therefore inhibition of Chromosome 20 Open Reading Frame 142 (C20orf142, Accession XM_059257). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf142. RI58

(Accession NM_012420) is another VGAM78 host target gene. RI58 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RI58, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RI58 BINDING SITE, designated SEQ ID:14797, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:2789.

[8386] Another function of VGAM78 is therefore inhibition of RI58 (Accession NM_012420). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RI58. Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037) is another VGAM78 host target gene. TNRC9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNRC9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNRC9 BINDING SITE, designated SEQ ID:35322, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:2789.

[8387] Another function of VGAM78 is therefore inhibition of Trinucleotide Repeat Containing 9 (TNRC9, Accession XM_049037). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNRC9. LOC135293 (Accession XM_072402) is another VGAM78 host target gene.

LOC135293 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC135293, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC135293 BINDING SITE, designated SEQ ID:37494, to the nucleotide sequence of VGAM78 RNA, herein designated VGAM RNA, also designated SEQ ID:2789.

[8388] Another function of VGAM78 is therefore inhibition of LOC135293 (Accession XM_072402). Accordingly, utilities of VGAM78 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC135293. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 79 (VGAM79) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8389] VGAM79 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM79 was detected is described hereinabove with reference to Figs. 1–8.

[8390] VGAM79 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8391] VGAM79 gene encodes a VGAM79 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM79 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM79 precursor RNA is designated SEQ ID:65, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:65 is located at position 44246 relative to the genome of Plutella Xylostella Granulovirus.

[8392] VGAM79 precursor RNA folds onto itself, forming VGAM79

folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8393] An enzyme complex designated DICER COMPLEX, `dices` the VGAM79 folded precursor RNA into VGAM79 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM79 RNA is designated SEQ ID:2790, and is provided hereinbelow with reference to the sequence listing part.

[8394] VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM79 host target RNA comprises three

regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8395] VGAM79 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM79 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM79 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target bind-

ing sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8396] The complementary binding of VGAM79 RNA, herein designated VGAM RNA, to host target binding sites on VGAM79 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM79 host target RNA into VGAM79 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8397] It is appreciated that VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM79 host target genes. The mRNA of each one of this plurality of VGAM79 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM79 RNA, herein designated VGAM RNA, and which when bound by VGAM79 RNA causes inhibition of translation of respective one or more VGAM79 host target proteins.

[8398] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM79 gene, herein designated VGAM GENE, on one or more VGAM79 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8399] It is yet further appreciated that a function of VGAM79 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM79 correlate with, and may be deduced from, the identity of the host target genes which VGAM79 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8400] Nucleotide sequences of the VGAM79 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM79 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM79 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM79 are further described hereinbelow with reference to Table 1.

[8401] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM79 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM79 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8402] As mentioned hereinabove with reference to Fig. 1, a function of VGAM79 gene, herein designated VGAM is inhibition of expression of VGAM79 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM79 correlate with, and may be deduced from, the identity of the target genes which VGAM79 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8403] FLJ20208 (Accession NM_017712) is a VGAM79 host tar-

get gene. FLJ20208 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20208, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20208 BINDING SITE, designated SEQ ID:19293, to the nucleotide sequence of VGAM79 RNA, herein designated VGAM RNA, also designated SEQ ID:2790.

[8404] A function of VGAM79 is therefore inhibition of FLJ20208 (Accession NM_017712). Accordingly, utilities of VGAM79 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20208. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 80 (VGAM80) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8405] VGAM80 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM80 was detected is described hereinabove with reference to Figs. 1–8.

[8406] VGAM80 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8407] VGAM80 gene encodes a VGAM80 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM80 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM80 precursor RNA is designated SEQ ID:66, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:66 is located at position 88821 relative to the genome of Plutella Xylostella Granulovirus.

[8408] VGAM80 precursor RNA folds onto itself, forming VGAM80 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide

sequence of the second half thereof.

[8409] An enzyme complex designated DICER COMPLEX, `dices` the VGAM80 folded precursor RNA into VGAM80 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM80 RNA is designated SEQ ID:2791, and is provided hereinbelow with reference to the sequence listing part.

[8410] VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM80 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8411] VGAM80 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM80 host target RNA,

herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM80 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM80 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8412] The complementary binding of VGAM80 RNA, herein designated VGAM RNA, to host target binding sites on VGAM80 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM80 host tar-

get RNA into VGAM80 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8413] It is appreciated that VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM80 host target genes. The mRNA of each one of this plurality of VGAM80 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM80 RNA, herein designated VGAM RNA, and which when bound by VGAM80 RNA causes inhibition of translation of respective one or more VGAM80 host target proteins.

[8414] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM80 gene, herein designated VGAM GENE, on one or more VGAM80 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and

Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8415] It is yet further appreciated that a function of VGAM80 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM80 correlate with, and may be deduced from, the identity of the host target genes which VGAM80 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8416] Nucleotide sequences of the VGAM80 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM80 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM80 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM80 are further described hereinbelow with reference to Table 1.

[8417] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM80 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM80 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8418] As mentioned hereinabove with reference to Fig. 1, a function of VGAM80 gene, herein designated VGAM is inhibition of expression of VGAM80 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM80 correlate with, and may be deduced from, the identity of the target genes which VGAM80 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8419] Latent Transforming Growth Factor Beta Binding Protein 1 (LTBP1, Accession NM_000627) is a VGAM80 host target gene. LTBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LTBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LTBP1 BINDING SITE, designated SEQ

ID:6242, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:2791.

[8420] A function of VGAM80 is therefore inhibition of Latent Transforming Growth Factor Beta Binding Protein 1 (LTBP1, Accession NM_000627), a gene which is involved in assembly and secretion of latent TGF-beta. Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LTBP1. The function of LTBP1 has been established by previous studies. Transforming growth factor beta molecules (e.g., TGFB1; 190180) are synthesized and secreted as latent, inactive complexes. In platelets, the latent form of human TGFB1 includes 3 components: TGFB1, the N-terminal peptide of the TGFB1 precursor, and a novel protein called the latent TGFB1-binding protein (LTBP1 Using a cDNA clone for LTBP1, Stenman et al. (1994) assigned the gene to chromosome 2 by study of a panel of well-defined human/rodent somatic cell hybrid lines and further localized the gene to 2p12-q22 by study of 3 hybrid lines containing partially overlapping fragments of chromosome 2.

[8421] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [8422] Oklu, R.; Hesketh, R. : The latent transforming growth factor beta binding protein (LTBP) family. *Biochem. J.* 352: 601–610, 2000. ; and
- [8423] Stenman, G.; Sahlin, P.; Olofsson, A.; Geurts van Kessel, A.; Miyazono, K. : Assignment of the gene encoding the latent TGF-beta-1-binding protein (LTBP1) to human chromosome 2, region p12.
- [8424] Further studies establishing the function and utilities of LTBP1 are found in John Hopkins OMIM database record ID 150390, and in cited publications numbered 12463–12465 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prolactin Receptor (PRLR, Accession NM_000949) is another VGAM80 host target gene. PRLR BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRLR BINDING SITE, designated SEQ ID:6649, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also des-

ignated SEQ ID:2791.

[8425] Another function of VGAM80 is therefore inhibition of Prolactin Receptor (PRLR, Accession NM_000949), a gene which is a receptor for the anterior pituitary hormone prolactin. Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRLR. The function of PRLR has been established by previous studies. Owerbach et al. (1981) did Southern blot analyses of DNA from human-mouse cell hybrids to show that the prolactin gene is located on chromosome 6 (Owerbach et al., 1981). It bears homology to the genes for growth hormone (OMIM Ref. No. 139250) and chorionic somatomammotropin (OMIM Ref. No. 150200), which are on chromosome 17, but not as close homology as these two bear to each other (Cooke et al., 1981). Only 16% sequence homology of the growth hormone and prolactin gene has been found (Shome and Parlow, 1977). The regional assignment of prolactin is of interest because of possible association between prolactin-secreting adenomas and specific HLA alleles (Farid et al., 1980). Larrea et al. (1987) presented the results of family studies suggesting that there is a familial factor determining the occurrence of the 'big-big' form as the predomi-

nant immunoreactive PRL species in blood. By somatic cell hybridization, Taggart et al. (1987) narrowed the assignment of the PRL gene to 6pter–p21.1. Evans et al. (1988, 1989) mapped the prolactin gene in a series of overlapping deletions of chromosome 6 produced by gamma-irradiation of a human lymphoblastoid cell line followed by selection for HLA antigen-loss mutants. As pointed out by DiMattia (1998), the PRL gene possesses alternative tissue-specific promoters that are located 5,563 basepairs apart. The 5-prime promoter is specific for expression of prolactin in the decidualized human endometrium and in lymphoblastoid cells such as the human cell line IM-9-P3; the downstream promoter is specific for expression in the pituitary lactotrope and is under the control of the POU-homeodomain transcription factor PIT1 (OMIM Ref. No. 173110). Transcriptional control of the nonpituitary start site is linked to the differentiation of the endometrial stromal cell into the decidual cell during the secretory phase of the ovulatory cycle (DiMattia et al., 1990, Gellersen et al., 1994). By deletion analysis of the human PRL promoter in endometrial stromal cells decidualized in vitro, Watanabe et al. (2001) demonstrated a 536-bp enhancer located between nucleotides –2040 and –1505 in

the 5-prime-flanking region. DNase I footprint analysis of decidualized endometrial stromal cells revealed 3 protected regions, FP1-FP3. Transfection of overlapping 100-bp fragments of the 536-bp enhancer indicated that FP1 and FP3 each conferred enhancer activity. Gel shift assays indicated that both FP1 and FP3 bind AP1 (OMIM Ref. No. 165160), and that JUND (OMIM Ref. No. 165162) and FOSL2 (OMIM Ref. No. 601575) are components of the AP1 complex in decidual fibroblasts. Mutation of the AP1 binding site in either FP1 or FP3 decreased enhancer activity by approximately 50%, while mutation of both sites almost completely abolished activity

[8426] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8427] Watanabe, K.; Kessler, C. A.; Bachurski, C. J.; Kanda, Y.; Richardson, B. D.; Stanek, J.; Handwerger, S.; Brar, A. K. : Identification of a decidua-specific enhancer on the human prolactin gene with two critical activator protein 1 (AP-1) binding sites. *Molec. Endocr.* 15: 638-653, 2001. ; and

[8428] DiMattia, G. E.; Gellersen, B.; Duckworth, M. L.; Friesen, H. G. : Human prolactin gene expression: the use of an alter-

native noncoding exon in decidua and the IM-9-P3 lymphoblast cell.

[8429] Further studies establishing the function and utilities of PRLR are found in John Hopkins OMIM database record ID 176761, and in cited publications numbered 9717-9724 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deducator of Cyto-kinesis 3 (DOCK3, Accession XM_039259) is another VGAM80 host target gene. DOCK3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DOCK3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DOCK3 BINDING SITE, designated SEQ ID:33033, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:2791.

[8430] Another function of VGAM80 is therefore inhibition of Deducator of Cyto-kinesis 3 (DOCK3, Accession XM_039259). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DOCK3. KIAA1483 (Accession XM_045920) is another VGAM80 host target gene.

KIAA1483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1483 BINDING SITE, designated SEQ ID:34615, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:2791.

[8431] Another function of VGAM80 is therefore inhibition of KIAA1483 (Accession XM_045920). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1483. SARM (Accession NM_015077) is another VGAM80 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17457, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:2791.

[8432] Another function of VGAM80 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. WD Repeat Domain 7 (WDR7, Accession NM_015285) is another VGAM80 host target gene. WDR7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by WDR7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WDR7 BINDING SITE, designated SEQ ID:17609, to the nucleotide sequence of VGAM80 RNA, herein designated VGAM RNA, also designated SEQ ID:2791.

[8433] Another function of VGAM80 is therefore inhibition of WD Repeat Domain 7 (WDR7, Accession NM_015285). Accordingly, utilities of VGAM80 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WDR7. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 81 (VGAM81) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8434] VGAM81 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM81 was detected is described hereinabove with reference to Figs. 1–8.

[8435] VGAM81 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8436] VGAM81 gene encodes a VGAM81 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM81 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM81 precursor RNA is designated SEQ ID:67, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:67 is located at position 95845 relative to the genome of Plutella Xylostella Granulovirus.

[8437] VGAM81 precursor RNA folds onto itself, forming VGAM81 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8438] An enzyme complex designated DICER COMPLEX, `dices` the VGAM81 folded precursor RNA into VGAM81 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM81 RNA is designated SEQ ID:2792, and is provided hereinbelow with reference to the sequence listing part.

[8439] VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM81 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8440] VGAM81 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM81 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM81 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[8441] The complementary binding of VGAM81 RNA, herein designated VGAM RNA, to host target binding sites on VGAM81 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM81 host target RNA into VGAM81 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8442] It is appreciated that VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM81 host target genes. The mRNA of each one of this plurality of VGAM81 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM81 RNA, herein designated VGAM RNA, and which when bound by VGAM81 RNA causes inhibition of translation of respective one or more VGAM81 host target proteins.

[8443] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM81 gene, herein designated VGAM GENE, on one or

more VGAM81 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8444] It is yet further appreciated that a function of VGAM81 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM81 correlate with, and may be deduced from, the identity of the host target genes which VGAM81 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8445] Nucleotide sequences of the VGAM81 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM81 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM81 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM81 are further de-
scribed hereinbelow with reference to Table 1.

[8446] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM81 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM81 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8447] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM81 gene, herein designated VGAM is in-
hibition of expression of VGAM81 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM81 correlate with, and may be deduced from, the
identity of the target genes which VGAM81 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[8448] A Disintegrin and Metalloproteinase Domain 22 (ADAM22,
Accession NM_021722) is a VGAM81 host target gene.

ADAM22 BINDING SITE1 and ADAM22 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by ADAM22, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADAM22 BINDING SITE1 and ADAM22 BINDING SITE2, designated SEQ ID:22324 and SEQ ID:22326 respectively, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8449] A function of VGAM81 is therefore inhibition of A Disintegrin and Metalloproteinase Domain 22 (ADAM22, Accession NM_021722), a gene which Member of ADAM family of zinc metalloproteases. Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADAM22. The function of ADAM22 has been established by previous studies. The cellular disintegrins, also known as ADAM (a disintegrin and metalloproteinase) and MDC (metalloproteinase-like, disintegrin-like, and cysteine-rich) proteins, are potential regulators of cell-cell and cell-matrix interactions. They contain multiple regions, including pro-, metalloproteinase-like, disintegrin-like,

cysteine-rich, epidermal growth factor-like, transmembrane, and cytoplasmic domains. By radiation hybrid analysis, Poindexter et al. (1999) mapped the ADAM22 gene to chromosome 7q21.

[8450] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8451] Poindexter, K.; Nelson, N.; DuBose, R. F.; Black, R. A.; Cerretti, D. P. : The identification of seven metalloproteinase-disintegrin (ADAM) genes from genomic libraries. *Gene* 237: 61-70, 1999. ; and

[8452] Sagane, K.; Ohya, Y.; Hasegawa, Y.; Tanaka, I. : Metalloproteinase-like, disintegrin-like, cysteine-rich proteins MDC2 and MDC3: novel human cellular disintegrins highly expressed in t.

[8453] Further studies establishing the function and utilities of ADAM22 are found in John Hopkins OMIM database record ID 603709, and in cited publications numbered 528 and 11444 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0650 (Accession XM_113962) is another VGAM81 host target gene. KIAA0650 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by KIAA0650, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0650 BINDING SITE, designated SEQ ID:42572, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8454] Another function of VGAM81 is therefore inhibition of KIAA0650 (Accession XM_113962). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0650. KIAA1155 (Accession XM_030864) is another VGAM81 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31194, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8455] Another function of VGAM81 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities

of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. NXP-2 (Accession XM_048706) is another VGAM81 host target gene. NXP-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NXP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXP-2 BINDING SITE, designated SEQ ID:35229, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8456] Another function of VGAM81 is therefore inhibition of NXP-2 (Accession XM_048706). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXP-2. SBBI31 (Accession NM_014035) is another VGAM81 host target gene. SBBI31 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by SBBI31, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SBBI31 BINDING SITE, designated SEQ

ID:15265, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8457] Another function of VGAM81 is therefore inhibition of SBBI31 (Accession NM_014035). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SBBI31. LOC151248 (Accession XM_087143) is another VGAM81 host target gene. LOC151248 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151248, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151248 BINDING SITE, designated SEQ ID:39085, to the nucleotide sequence of VGAM81 RNA, herein designated VGAM RNA, also designated SEQ ID:2792.

[8458] Another function of VGAM81 is therefore inhibition of LOC151248 (Accession XM_087143). Accordingly, utilities of VGAM81 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151248. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 82 (VGAM82) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8459] VGAM82 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM82 was detected is described hereinabove with reference to Figs. 1–8.

[8460] VGAM82 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8461] VGAM82 gene encodes a VGAM82 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM82 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM82 precursor RNA is designated SEQ ID:68, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:68 is located at position 37903 relative to the genome of

Plutella Xylostella Granulovirus.

[8462] VGAM82 precursor RNA folds onto itself, forming VGAM82 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8463] An enzyme complex designated DICER COMPLEX, `dices` the VGAM82 folded precursor RNA into VGAM82 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 55%) nucleotide sequence of VGAM82 RNA is designated SEQ ID:2793, and is provided hereinbelow with reference to the sequence listing part.

[8464] VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM82 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8465] VGAM82 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM82 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM82 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8466] The complementary binding of VGAM82 RNA, herein designated VGAM RNA, to host target binding sites on VGAM82 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM82 host target RNA into VGAM82 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8467] It is appreciated that VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM82 host target genes. The mRNA of each one of this plurality of VGAM82 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM82 RNA, herein designated VGAM RNA, and which when bound by VGAM82 RNA causes inhibition of translation of respective one or more VGAM82 host target proteins.

[8468] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM82 gene, herein designated VGAM GENE, on one or more VGAM82 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8469] It is yet further appreciated that a function of VGAM82 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM82 correlate with, and may be deduced from, the identity of the host target genes which VGAM82 binds and

inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8470] Nucleotide sequences of the VGAM82 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM82 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM82 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM82 are further described hereinbelow with reference to Table 1.

[8471] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM82 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM82 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8472] As mentioned hereinabove with reference to Fig. 1, a function of VGAM82 gene, herein designated VGAM is inhibition of expression of VGAM82 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM82 correlate with, and may be deduced from, the identity of the target genes which VGAM82 binds and inhibits, and the function of these target genes, as elabo-

rated hereinbelow.

[8473] LOC145761 (Accession XM_096855) is a VGAM82 host target gene. LOC145761 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145761 BINDING SITE, designated SEQ ID:40581, to the nucleotide sequence of VGAM82 RNA, herein designated VGAM RNA, also designated SEQ ID:2793.

[8474] A function of VGAM82 is therefore inhibition of LOC145761 (Accession XM_096855). Accordingly, utilities of VGAM82 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145761. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 83 (VGAM83) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8475] VGAM83 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM83 was detected is described hereinabove with reference to Figs. 1–8.

[8476] VGAM83 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8477] VGAM83 gene encodes a VGAM83 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM83 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM83 precursor RNA is designated SEQ ID:69, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:69 is located at position 58052 relative to the genome of Plutella Xylostella Granulovirus.

[8478] VGAM83 precursor RNA folds onto itself, forming VGAM83 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8479] An enzyme complex designated DICER COMPLEX, `dices` the VGAM83 folded precursor RNA into VGAM83 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 43%) nucleotide sequence of VGAM83 RNA is designated SEQ ID:2794, and is provided hereinbelow with reference to the sequence listing part.

[8480] VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM83 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8481] VGAM83 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM83 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM83 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8482] The complementary binding of VGAM83 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM83 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM83 host target RNA into VGAM83 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8483] It is appreciated that VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM83 host target genes. The mRNA of each one of this plurality of VGAM83 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM83 RNA, herein designated VGAM RNA, and which when bound by VGAM83 RNA causes inhibition of translation of respective one or more VGAM83 host target proteins.

[8484] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM83 gene, herein designated VGAM GENE, on one or more VGAM83 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8485] It is yet further appreciated that a function of VGAM83 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM83 correlate with, and may be deduced from, the identity of the host target genes which VGAM83 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8486] Nucleotide sequences of the VGAM83 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM83 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM83 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM83 are further described hereinbelow with reference to Table 1.

[8487] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM83 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM83 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8488] As mentioned hereinabove with reference to Fig. 1, a function of VGAM83 gene, herein designated VGAM is inhibition of expression of VGAM83 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM83 correlate with, and may be deduced from, the identity of the target genes which VGAM83 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8489] Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM_006310) is a VGAM83 host target gene. NPEPPS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPEPPS, corresponding to a HOST TARGET binding site such as BINDING

SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPEPPS BINDING SITE, designated SEQ ID:12995, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8490] A function of VGAM83 is therefore inhibition of Aminopeptidase Puromycin Sensitive (NPEPPS, Accession NM_006310), a gene which is puromycin-sensitive aminopeptidase and has metallopeptidase activity. Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPEPPS. The function of NPEPPS has been established by previous studies. Tobler et al. (1997) cloned PSA from a human fetal brain cDNA library using the mouse PSA cDNA as probe. They established that translation is initiated at the second of 2 possible start codons, resulting in a deduced 875-amino acid protein with a molecular mass of 99 kD by SDS-PAGE. PSA contains a zinc-binding motif conserved among gluzincin aminopeptidases and shares 98% sequence identity with the mouse protein. Northern blot analysis detected ubiquitous expression of a 4.8-kb transcript, with highest expression in brain. By in situ hybridization of adult human

brain sections, expression was localized to the perikaryon of neurons of the cortex and cerebellum. Using immunofluorescence localization of transfected HeLa cells, Tobler et al. (1997) found that PSA localizes to the perinuclear cytoplasm and shows a filamentous staining pattern. Bauer et al. (2001) cloned PSA cDNA from a human skeletal muscle library. Northern blot analysis detected major and minor transcripts of 4.8 and 4.2 kb, respectively. Huber et al. (1999) determined that PSA is identical to the metalloprotease MP100 that was originally isolated as a beta-secretase candidate from human brain by Schonlein et al. (1994). Huber et al. (1999) were able to colocalize and coimmunoprecipitate PSA with beta-amyloid precursor protein (OMIM Ref. No. 104760); however, PSA did not increase production of the amyloid-beta peptide in cotransfected cells. By RT-PCR, but not by Northern blot analysis, Bauer et al. (2001) found that PSA was upregulated in human leukemic cells following vitamin D stimulation.

[8491] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8492] Huber, G.; Thompson, A.; Gruninger, F.; Mechler, H.;

Hochstrasser, R.; Hauri, H.-P.; Malherbe, P. : cDNA cloning and molecular characterization of human brain metallo-protease MP100: a beta-secretase candidate? J. Neurochem. 72: 1215-1223, 1999. ; and

[8493] Tobler, A. R.; Constam, D. B.; Schmitt-Graff, A.; Malipiero, U.; Schlapbach, R.; Fontana, A. : Cloning of the human puromycin-sensitive aminopeptidase and evidence for expression in neu.

[8494] Further studies establishing the function and utilities of NPEPPS are found in John Hopkins OMIM database record ID 606793, and in cited publications numbered 5485-5490 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823) is another VGAM83 host target gene. PKIA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PKIA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKIA BINDING SITE, designated SEQ ID:13697, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8495] Another function of VGAM83 is therefore inhibition of Protein Kinase (cAMP-dependent, catalytic) Inhibitor Alpha (PKIA, Accession NM_006823). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKIA. Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630) is another VGAM83 host target gene. SLC21A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC21A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC21A2 BINDING SITE, designated SEQ ID:12155, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8496] Another function of VGAM83 is therefore inhibition of Solute Carrier Family 21 (prostaglandin transporter), Member 2 (SLC21A2, Accession NM_005630), a gene which is a Prostaglandin transporter. Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC21A2. The function of SLC21A2 has been established by previ-

ous studies. At physiologic pH, prostaglandins (PGs) traverse biologic membranes poorly. Accordingly, PG transport is carrier-mediated in many tissues, including the lung, choroid plexus, liver, anterior chamber of the eye, vagina and uterus, and placenta. Kanai et al. (1995) cloned the rat prostaglandin transporter (symbolized PGT by them) and postulated 3 possible roles for the transporter. First, PGT might mediate the efflux of newly synthesized PGs from cells. Second, PGT might mediate epithelial PG transport. A third possible role of PGT is that of mediating PG clearance and degradation. Lu et al. (1996) favored the clearance role for PGT. Using a rat PGT probe on Northern blots of human kidney mRNA, they found evidence for the presence of a human PGT homolog. They screened a human kidney cDNA library and isolated human PGT. The gene encodes a 643-amino acid polypeptide with 82% identity to the rat protein. They expressed a full-length human cDNA clone in cultured cells and reported that both rat and human PGT transport PGD₂, as well as PGE₁, PGE₂, and PGF_{2a}. Although human PGT has cDNA and deduced amino acid sequences similar to those of the rat, the tissue distribution of mRNA transcripts is substantially broader in human. Additionally, the diversity

of human PGT transcripts is greater and the affinity for thromboxane-2 is greater. Lu et al. (1996) found strong PGT mRNA expression in the human fetus. By PCR-based monochromosomal somatic cell hybrid mapping and fluorescence in situ hybridization, Lu and Schuster (1998) mapped the PGT gene to 3q21.

[8497] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8498] Kanai, N.; Lu, R.; Satriano, J. A.; Bao, Y.; Wolkoff, A. W.; Schuster, V. L. : Identification and characterization of a prostaglandin transporter. Science 268: 866–869, 1995. ; and

[8499] Lu, R.; Kanai, N.; Bao, Y.; Schuster, V. L. : Cloning, in vitro expression, and tissue distribution of a human prostaglandin transporter cDNA (hPGT). J. Clin. Invest. 98: 1142–1149, 1996.

[8500] Further studies establishing the function and utilities of SLC21A2 are found in John Hopkins OMIM database record ID 601460, and in cited publications numbered 2867–2869 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp547M072 (Accession XM_028067) is another

VGAM83 host target gene. DKFZp547M072 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547M072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547M072 BINDING SITE, designated SEQ ID:30613, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8501] Another function of VGAM83 is therefore inhibition of DKFZp547M072 (Accession XM_028067). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547M072. FLJ10761 (Accession NM_018208) is another VGAM83 host target gene. FLJ10761 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10761, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10761 BINDING SITE, designated SEQ ID:20104, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8502] Another function of VGAM83 is therefore inhibition of FLJ10761 (Accession NM_018208). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10761. P17.3 (Accession NM_019056) is another VGAM83 host target gene. P17.3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P17.3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P17.3 BINDING SITE, designated SEQ ID:21137, to the nucleotide sequence of VGAM83 RNA, herein designated VGAM RNA, also designated SEQ ID:2794.

[8503] Another function of VGAM83 is therefore inhibition of P17.3 (Accession NM_019056). Accordingly, utilities of VGAM83 include diagnosis, prevention and treatment of diseases and clinical conditions associated with P17.3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 84 (VGAM84) viral gene, which modulates expression of respective host target genes thereof, the function and

utility of which host target genes is known in the art.

[8504] VGAM84 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM84 was detected is described hereinabove with reference to Figs. 1–8.

[8505] VGAM84 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM84 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8506] VGAM84 gene encodes a VGAM84 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM84 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM84 precursor RNA is designated SEQ ID:70, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:70 is located at position 12458 relative to the genome of Plutella Xylostella Granulovirus.

[8507] VGAM84 precursor RNA folds onto itself, forming VGAM84 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8508] An enzyme complex designated DICER COMPLEX, `dices` the VGAM84 folded precursor RNA into VGAM84 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM84 RNA is designated SEQ ID:2795, and is provided hereinbelow with reference to the sequence listing part.

[8509] VGAM84 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM84 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8510] VGAM84 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM84 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM84 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8511] The complementary binding of VGAM84 RNA, herein designated VGAM RNA, to host target binding sites on VGAM84 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM84 host target RNA into VGAM84 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8512] It is appreciated that VGAM84 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM84 host target genes. The mRNA of each one of this plurality of VGAM84 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM84 RNA, herein designated VGAM RNA, and which when bound by VGAM84 RNA causes inhibition of translation of respective one or more VGAM84 host target proteins.

[8513] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM84 gene, herein designated VGAM GENE, on one or more VGAM84 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8514] It is yet further appreciated that a function of VGAM84 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM84 correlate with, and may be deduced from, the identity of the host target genes which VGAM84 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8515] Nucleotide sequences of the VGAM84 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM84 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM84 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM84 are further described hereinbelow with reference to Table 1.

[8516] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM84 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM84 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8517] As mentioned hereinabove with reference to Fig. 1, a function of VGAM84 gene, herein designated VGAM is inhibition of expression of VGAM84 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM84 correlate with, and may be deduced from, the identity of the target genes which VGAM84 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8518] Transmembrane 4 Superfamily Member 6 (TM4SF6, Accession NM_003270) is a VGAM84 host target gene. TM4SF6 BINDING SITE is HOST TARGET binding site found

in the 3' untranslated region of mRNA encoded by TM4SF6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TM4SF6 BINDING SITE, designated SEQ ID:9282, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:2795.

[8519] A function of VGAM84 is therefore inhibition of Trans-membrane 4 Superfamily Member 6 (TM4SF6, Accession NM_003270), a gene which plays a role in the regulation of cell development, activation, growth and motility. Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TM4SF6. The function of TM4SF6 has been established by previous studies. Members of the trans-membrane 4 (or tetraspanin) superfamily (TM4SF) contain 4 hydrophobic, presumably membrane-spanning sequences and a major presumed extracellular loop between the third and fourth hydrophobic domains. Several TM4SF proteins have been shown to stimulate or modulate cell growth, and some may associate with integrin and control cell adhesion and movement. Maeda et al. (1998) isolated

a human glioma cDNA that has sequence similarity to the TM4SF member TM4SF2 (OMIM Ref. No. 300096). By screening a human fetal lung cDNA library with a probe corresponding to the combined sequences of this cDNA and of an overlapping EST, they isolated cDNAs with an open reading frame encoding a deduced 245–amino acid protein termed TM4SF6. The TM4SF6 protein contains 4 putative transmembrane domains, several short cysteine motifs characteristic of TM4SF proteins, and a potential N–glycosylation site. The TM4SF6 and TM4SF2 proteins are 58% homologous. TM4SF6 was expressed as 1.9– and 1.3–kb transcripts in all human tissues examined.

[8520] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8521] Maeda, K.; Matsushashi, S.; Hori, K.; Xin, Z.; Mukai, T.; Tabuchi, K.; Egashira, M.; Niikawa, N. : Cloning and characterization of a novel human gene, TM4SF6, encoding a protein belonging to the transmembrane 4 superfamily, and mapped to Xq22. *Genomics* 52: 240–242, 1998. ; and

[8522] Todd, S. C.; Doctor, V. S.; Levy, S. : Sequences and expression of six new members of the tetraspanin/TM4SF family. *Biochim. Biophys. Acta* 1399: 101–104, 1998.

[8523] Further studies establishing the function and utilities of TM4SF6 are found in John Hopkins OMIM database record ID 300191, and in cited publications numbered 11388–11389 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA1239 (Accession XM_049078) is another VGAM84 host target gene. KIAA1239 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1239, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1239 BINDING SITE, designated SEQ ID:35340, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:2795.

[8524] Another function of VGAM84 is therefore inhibition of KIAA1239 (Accession XM_049078). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1239. KIAA1423 (Accession XM_029703) is another VGAM84 host target gene. KIAA1423 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1423, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1423 BINDING SITE, designated SEQ ID:30918, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:2795.

[8525] Another function of VGAM84 is therefore inhibition of KIAA1423 (Accession XM_029703). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1423. MGC23980 (Accession NM_145005) is another VGAM84 host target gene. MGC23980 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC23980, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC23980 BINDING SITE, designated SEQ ID:29604, to the nucleotide sequence of VGAM84 RNA, herein designated VGAM RNA, also designated SEQ ID:2795.

[8526] Another function of VGAM84 is therefore inhibition of MGC23980 (Accession NM_145005). Accordingly, utilities of VGAM84 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC23980. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 85 (VGAM85) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8527] VGAM85 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM85 was detected is described hereinabove with reference to Figs. 1–8.

[8528] VGAM85 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8529] VGAM85 gene encodes a VGAM85 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM85 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM85 precursor RNA is designated SEQ

ID:71, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:71 is located at position 61916 relative to the genome of *Plutella Xylostella Granulovirus*.

[8530] VGAM85 precursor RNA folds onto itself, forming VGAM85 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8531] An enzyme complex designated DICER COMPLEX, `dices` the VGAM85 folded precursor RNA into VGAM85 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM85 RNA is designated SEQ ID:2796, and is provided hereinbelow with reference to the sequence list-

ing part.

[8532] VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM85 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8533] VGAM85 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM85 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM85 RNA, herein designated VGAM RNA, may have a different num-

ber of host target binding sites in untranslated regions of a VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8534] The complementary binding of VGAM85 RNA, herein designated VGAM RNA, to host target binding sites on VGAM85 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM85 host target RNA into VGAM85 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8535] It is appreciated that VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM85 host target genes. The mRNA of each one of this plurality of VGAM85 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM85 RNA, herein designated VGAM RNA, and which when bound by VGAM85 RNA causes in–

hibition of translation of respective one or more VGAM85 host target proteins.

[8536] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM85 gene, herein designated VGAM GENE, on one or more VGAM85 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8537] It is yet further appreciated that a function of VGAM85 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Gran-

ulovirus. Specific functions, and accordingly utilities, of VGAM85 correlate with, and may be deduced from, the identity of the host target genes which VGAM85 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8538] Nucleotide sequences of the VGAM85 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM85 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM85 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM85 are further described hereinbelow with reference to Table 1.

[8539] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM85 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM85 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8540] As mentioned hereinabove with reference to Fig. 1, a function of VGAM85 gene, herein designated VGAM is inhibition of expression of VGAM85 target genes. It is appreciated that specific functions, and accordingly utilities,

of VGAM85 correlate with, and may be deduced from, the identity of the target genes which VGAM85 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8541] Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141) is a VGAM85 host target gene. CNTNAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNTNAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNTNAP2 BINDING SITE, designated SEQ ID:15420, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8542] A function of VGAM85 is therefore inhibition of Contactin Associated Protein-like 2 (CNTNAP2, Accession NM_014141). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CNTNAP2. Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943) is another VGAM85 host target gene. GRLF1 BINDING SITE is HOST TARGET binding site found in the

3` untranslated region of mRNA encoded by GRLF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRLF1 BINDING SITE, designated SEQ ID:38415, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8543] Another function of VGAM85 is therefore inhibition of Glucocorticoid Receptor DNA Binding Factor 1 (GRLF1, Accession XM_085943), a gene which inhibits transcription of the glucocorticoid receptor gene. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRLF1. The function of GRLF1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM55. Lipin 2 (LPIN2, Accession NM_014646) is another VGAM85 host target gene. LPIN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LPIN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LPIN2 BIND-

ING SITE, designated SEQ ID:16060, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8544] Another function of VGAM85 is therefore inhibition of Lipin 2 (LPIN2, Accession NM_014646). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LPIN2. POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM_001334) is another VGAM85 host target gene. POU3F1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POU3F1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POU3F1 BINDING SITE, designated SEQ ID:29831, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8545] Another function of VGAM85 is therefore inhibition of POU Domain, Class 3, Transcription Factor 1 (POU3F1, Accession XM_001334), a gene which involves in early embryogenesis and neurogenesis. Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with POU3F1. The function of POU3F1 has been established by previous studies. The vertebrate class III POU transcription factors consist of 4 members: POU3F1 (Oct-6), POU3F2 (OMIM Ref. No. 600494), POU3F3 (Brain-1), and POU3F4 (Brain-4; 300039). The chromosomal locations of the murine class III POU genes were determined by interspecific backcross analysis (Avraham et al., 1993; Xia et al., 1993). On the basis of mouse-human chromosomal homologies, human POU3F1 and POU3F3 were expected to map to 1p and 2q, respectively. Sumiyama et al. (1998) found that the location of POU3F1 was consistent with this position, mapping to 1p34.1 by FISH. Contrary to the prediction, however, POU3F3 was mapped to 3p14.2 by the same method. The human POU3F2 and POU3F4 genes map to 6q16 and Xq21.1, respectively. Thus, the 4 human class III POU genes map to different chromosomes. A phylogenetic tree of these 4 genes shows that they emerged in a common ancestor of vertebrates. Studies of the genome structure of vertebrates suggest that genome duplication occurred at least twice in the early stage of vertebrate evolution; 4 homologous complexes such as Hox and MHC are interspersed in the mammalian genome. The

findings with the 4 class III POU genes are consistent with the idea of 2 genome duplications. Xia et al. (1993) mapped the mouse homolog of the POU3F1 gene, called Tst1 by them, to chromosome 4. Most mice homozygous for a mutant Pou3f1 die soon after birth (Bermingham et al., 1996; Jaegle et al., 1996).

[8546] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8547] Sumiyama, K.; Washio-Watanabe, K.; Ono, T.; Yoshida, M. C.; Hayakawa, T.; Ueda, S. : Human class III POU genes, POU3F1 and POU3F3, map to chromosomes 1p34.1 and 3p14.1. Mammalian Genome 9: 180–181, 1998. ; and

[8548] Xia, Y.-R.; Andersen, B.; Mehrabian, M.; Diep, A. T.; Warden, C. H.; Mohandas, T.; McEvilly, R. J.; Rosenfeld, M. G.; Lusk, A. J. : Chromosomal organization of mammalian POU domain factors.

[8549] Further studies establishing the function and utilities of POU3F1 are found in John Hopkins OMIM database record ID 602479, and in cited publications numbered 7963, 8632–863 and 10196 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Angiomin Like 1 (AMOTL1, Accession XM_057045)

is another VGAM85 host target gene. AMOTL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMOTL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMOTL1 BINDING SITE, designated SEQ ID:36467, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8550] Another function of VGAM85 is therefore inhibition of Angiomotin Like 1 (AMOTL1, Accession XM_057045). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMOTL1. CSRP2 Binding Protein (CSRP2BP, Accession XM_046520) is another VGAM85 host target gene. CSRP2BP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CSRP2BP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSRP2BP BINDING SITE, designated SEQ ID:34736, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ

ID:2796.

[8551] Another function of VGAM85 is therefore inhibition of CSRP2 Binding Protein (CSRP2BP, Accession XM_046520). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSRP2BP. DKFZP564O0463 (Accession NM_014156) is another VGAM85 host target gene. DKFZP564O0463 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564O0463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564O0463 BINDING SITE, designated SEQ ID:15443, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8552] Another function of VGAM85 is therefore inhibition of DKFZP564O0463 (Accession NM_014156). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564O0463. KIAA0227 (Accession XM_027236) is another VGAM85 host target gene. KIAA0227 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by KIAA0227, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0227 BINDING SITE, designated SEQ ID:30448, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8553] Another function of VGAM85 is therefore inhibition of KIAA0227 (Accession XM_027236). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0227. KIAA0618 (Accession NM_014833) is another VGAM85 host target gene. KIAA0618 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0618 BINDING SITE, designated SEQ ID:16835, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8554] Another function of VGAM85 is therefore inhibition of KIAA0618 (Accession NM_014833). Accordingly, utilities

of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0618. KIAA0711 (Accession NM_014867) is another VGAM85 host target gene. KIAA0711 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0711, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0711 BINDING SITE, designated SEQ ID:16955, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8555] Another function of VGAM85 is therefore inhibition of KIAA0711 (Accession NM_014867). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0711. KIAA1046 (Accession NM_014928) is another VGAM85 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1046 BINDING SITE, designated SEQ ID:17220, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8556] Another function of VGAM85 is therefore inhibition of KIAA1046 (Accession NM_014928). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. Zinc Finger Protein 387 (ZNF387, Accession NM_014682) is another VGAM85 host target gene. ZNF387 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZNF387, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZNF387 BINDING SITE, designated SEQ ID:16174, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8557] Another function of VGAM85 is therefore inhibition of Zinc Finger Protein 387 (ZNF387, Accession NM_014682). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZNF387. LOC199990 (Accession

XM_114083) is another VGAM85 host target gene.

LOC199990 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC199990, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC199990 BINDING SITE, designated SEQ ID:42681, to the nucleotide sequence of VGAM85 RNA, herein designated VGAM RNA, also designated SEQ ID:2796.

[8558] Another function of VGAM85 is therefore inhibition of LOC199990 (Accession XM_114083). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC199990. LOC91170 (Accession XM_036612) is another VGAM85 host target gene. LOC91170 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91170, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91170 BINDING SITE, designated SEQ ID:32480, to the nucleotide sequence of VGAM85 RNA, herein designated

VGAM RNA, also designated SEQ ID:2796.

[8559] Another function of VGAM85 is therefore inhibition of LOC91170 (Accession XM_036612). Accordingly, utilities of VGAM85 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91170. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 86 (VGAM86) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8560] VGAM86 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM86 was detected is described hereinabove with reference to Figs. 1–8.

[8561] VGAM86 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8562] VGAM86 gene encodes a VGAM86 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM86 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM86 precursor RNA is designated SEQ ID:72, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:72 is located at position 28852 relative to the genome of *Plutella Xylostella Granulovirus*.

[8563] VGAM86 precursor RNA folds onto itself, forming VGAM86 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8564] An enzyme complex designated DICER COMPLEX, `dices` the VGAM86 folded precursor RNA into VGAM86 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM86 RNA is designated SEQ ID:2797, and is provided hereinbelow with reference to the sequence listing part.

[8565] VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM86 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8566] VGAM86 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM86 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM86 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8567] The complementary binding of VGAM86 RNA, herein designated VGAM RNA, to host target binding sites on VGAM86 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM86 host target RNA into VGAM86 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8568] It is appreciated that VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM86 host target genes. The mRNA of each one of this plurality of VGAM86 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM86 RNA, herein designated VGAM RNA, and which when bound by VGAM86 RNA causes inhibition of translation of respective one or more VGAM86 host target proteins.

[8569] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM86 gene, herein designated VGAM GENE, on one or more VGAM86 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8570] It is yet further appreciated that a function of VGAM86 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM86 correlate with, and may be deduced from, the identity of the host target genes which VGAM86 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8571] Nucleotide sequences of the VGAM86 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM86 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM86 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM86 are further described hereinbelow with reference to Table 1.

[8572] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM86 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM86 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8573] As mentioned hereinabove with reference to Fig. 1, a function of VGAM86 gene, herein designated VGAM is inhibition of expression of VGAM86 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM86 correlate with, and may be deduced from, the identity of the target genes which VGAM86 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8574] HCGIV.9 (Accession NM_018985) is a VGAM86 host target gene. HCGIV.9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by HCGIV.9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HCGIV.9 BINDING SITE, designated SEQ ID:21056, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:2797.

[8575] A function of VGAM86 is therefore inhibition of HCGIV.9 (Accession NM_018985). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HCGIV.9. LOC127534 (Accession XM_060532) is another VGAM86

host target gene. LOC127534 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC127534, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC127534 BINDING SITE, designated SEQ ID:37162, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:2797.

[8576] Another function of VGAM86 is therefore inhibition of LOC127534 (Accession XM_060532). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC127534. LOC222171 (Accession XM_166586) is another VGAM86 host target gene. LOC222171 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC222171, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222171 BINDING SITE, designated SEQ ID:44557, to the nucleotide sequence of VGAM86 RNA, herein designated VGAM RNA, also designated SEQ ID:2797.

[8577] Another function of VGAM86 is therefore inhibition of LOC222171 (Accession XM_166586). Accordingly, utilities of VGAM86 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222171. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 87 (VGAM87) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8578] VGAM87 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM87 was detected is described hereinabove with reference to Figs. 1–8.

[8579] VGAM87 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8580] VGAM87 gene encodes a VGAM87 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM87

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM87 precursor RNA is designated SEQ ID:73, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:73 is located at position 79962 relative to the genome of *Plutella Xylostella Granulovirus*.

[8581] VGAM87 precursor RNA folds onto itself, forming VGAM87 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8582] An enzyme complex designated DICER COMPLEX, `dices` the VGAM87 folded precursor RNA into VGAM87 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 78%) nucleotide sequence of VGAM87 RNA is designated SEQ ID:2798, and is provided hereinbelow with reference to the sequence listing part.

[8583] VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM87 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8584] VGAM87 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM87 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host tar-

get binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM87 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8585] The complementary binding of VGAM87 RNA, herein designated VGAM RNA, to host target binding sites on VGAM87 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM87 host target RNA into VGAM87 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8586] It is appreciated that VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM87 host target genes. The mRNA of each one of this plurality of VGAM87 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM87 RNA, herein designated VGAM RNA, and which when bound by VGAM87 RNA causes inhibition of translation of respective one or more VGAM87 host target proteins.

[8587] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM87 gene, herein designated VGAM GENE, on one or more VGAM87 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8588] It is yet further appreciated that a function of VGAM87 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM87 correlate with, and may be deduced from, the identity of the host target genes which VGAM87 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8589] Nucleotide sequences of the VGAM87 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM87 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM87 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM87 are further described hereinbelow with reference to Table 1.

[8590] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM87 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM87 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8591] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM87 gene, herein designated VGAM is inhibition of expression of VGAM87 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM87 correlate with, and may be deduced from, the identity of the target genes which VGAM87 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8592] Plexin B2 (PLXNB2, Accession NM_012401) is a VGAM87 host target gene. PLXNB2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLXNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLXNB2 BINDING SITE, designated SEQ ID:14778, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8593] A function of VGAM87 is therefore inhibition of Plexin B2 (PLXNB2, Accession NM_012401), a gene which is a novel member of the plexin family. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLXNB2. The function of PLXNB2 has been established by previous

studies. Using the technique of differential display, Shinoura et al. (1995) identified a cDNA fragment that was differentially expressed in malignant vs benign brain tumors. By screening a human fetal brain cDNA library with this fragment, they isolated a novel cDNA, which they termed MM1. MM1 was expressed almost 8-fold higher in glioblastomas compared to low-grade astrocytomas and slightly higher in malignant meningiomas than in benign meningiomas. By screening human brain cDNAs for those encoding proteins larger than 60 kD, Nagase et al. (1997) identified the MM1 gene, which they called KIAA0315. By RT-PCR amplification starting from the partial cDNA sequences of clones MM1 and KIAA0315, Tamagnone et al. (1999) identified the cDNA sequence of a novel member of the plexin gene family and named the gene plexin B2. Using a radiation hybrid mapping panel, Nagase et al. (1997) mapped the PLXNB2 gene to chromosome 22. By sequence analysis, Tamagnone et al. (1999) showed that the PLXNB2 gene maps to 22q13.31-q13.33 in the BAC clone (GenBank AL022328) containing the MAPK12 (OMIM Ref. No. 602399) and MAPK11 (OMIM Ref. No. 602898) genes.

[8594] Full details of the abovementioned studies are described

in the following publications, the disclosure of which are hereby incorporated by reference:

- [8595] Shinoura, N.; Shamraj, O. I.; Hugenholtz, H.; Zhu, J. G.; McBlack, P.; Warnick, R.; Tew, J. J.; Wani, M. A.; Menon, A. G. : Identification and partial sequence of a cDNA that is differentially expressed in human brain tumors. *Cancer Lett.* 89: 215–221, 1995. ; and
- [8596] Tamagnone, L.; Artigiani, S.; Chen, H.; He, Z.; Ming, G.; Song, H.; Chedotal, A.; Winberg, M. L.; Goodman, C. S.; Poo, M.; Tessier-Lavigne, M.; Comoglio, P. M. : Plexins are a large fam.
- [8597] Further studies establishing the function and utilities of PLXNB2 are found in John Hopkins OMIM database record ID 604293, and in cited publications numbered 957, 707 and 7272 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983) is another VGAM87 host target gene. SLC7A6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC7A6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the com-

plementarity of the nucleotide sequences of SLC7A6 BINDING SITE, designated SEQ ID:10128, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8598] Another function of VGAM87 is therefore inhibition of Solute Carrier Family 7 (cationic amino acid transporter, γ^+ system), Member 6 (SLC7A6, Accession NM_003983), a gene which is involved in mediating amino acid transport. Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC7A6. The function of SLC7A6 has been established by previous studies. Using RT-PCR with degenerate primers to screen for amino acid transporters in opossum kidney, followed by searching EST databases, Torrents et al. (1998) obtained a cDNA encoding SLC7A6, which they called $\gamma(+)$ LAT2. SLC7A6 is identical to the KIAA0245 gene reported by Nagase et al. (1996). Sequence analysis predicted that SLC7A6 is a 515-amino acid, typical organic solute transporter protein with 12 transmembrane domains, 3 potential phosphorylation sites, and N- and C-terminal cytoplasmic segments. SLC7A6 shares 75% amino acid identity with the opossum sequence and $\gamma(+)$ LAT1 (SLC7A7; 603593). By RT-PCR

analysis, Nagase et al. (1996) detected SLC7A6 expression in all tissues tested except liver; expression was weak in pancreas and highest in thymus.

[8599] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8600] Nagase, T.; Seki, N.; Ishikawa, K.; Ohira, M.; Kawarabayasi, Y.; Ohara, O.; Tanaka, A.; Kotani, H.; Miyajima, N.; Nomura, N. : Prediction of the coding sequences of unidentified human genes. VI. The coding sequences of 80 new genes (KIAA0201–KIAA0280) deduced by analysis of cDNA clones from cell line KG–1 and brain. DNA Res. 3: 321–329, 1996. ; and

[8601] Torrents, D.; Estevez, R.; Pineda, M.; Fernandez, E.; Lloberas, J.; Shi, Y.–B.; Zorzano, A.; Palacin, M. : Identification and characterization of a membrane protein (y(+))L amino acid tr.

[8602] Further studies establishing the function and utilities of SLC7A6 are found in John Hopkins OMIM database record ID 605641, and in cited publications numbered 9379 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Ubiquitin Fusion Degradation 1–like (UFD1L, Accession XM_055490) is an–

other VGAM87 host target gene. UFD1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UFD1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UFD1L BINDING SITE, designated SEQ ID:36275, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8603] Another function of VGAM87 is therefore inhibition of Ubiquitin Fusion Degradation 1-like (UFD1L, Accession XM_055490), a gene which is essential component of the ubiquitin-dependent proteolytic pathway . Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UFD1L. The function of UFD1L has been established by previous studies. In a search for genes in the 22q11.2 region possibly implicated in the DiGeorge syndrome (OMIM Ref. No. 188400), Pizutti et al. (1997) identified a gene whose functional features and tissue-specific expression suggested a distinct role in embryogenesis. Symbolized UFD1L by them (for ubiquitin fusion degradation 1-like), the gene encodes the human homolog of the

yeast ubiquitin fusion degradation 1 (UFD1) protein that is involved in the degradation of ubiquitin fusion proteins (see OMIM Ref. No. 191320). Cloning and characterization of the murine homolog (Ufd1l) showed it to be expressed during embryogenesis in the eyes and in the inner ear primordia. These findings suggested to Pizutti et al. (1997) that the proteolytic pathway recognizing ubiquitin fusion proteins for degradation is conserved in vertebrates and that UFD1L gene hemizyosity may be the cause of some of the CATCH22-associated developmental defects. The basic helix-loop-helix transcription factor dHAND (HAND2; 602407) is required for survival of cells in the neural crest-derived branchial and aortic arch arteries and the right ventricle. Mice lacking endothelin-1 (EDN1; 131240) have cardiac and cranial neural crest defects typical of the 22q11 deletion syndrome and display down-regulation of dHAND, suggesting that a molecular pathway involving dHAND may be disrupted in that syndrome. The HAND2, EDN1, and ET1 receptor (EDNRA; 131243) genes do not map to 22q11, the DiGeorge syndrome critical region, in humans. In a screen for mouse genes dependent on dHAND, Yamagishi et al. (1999) identified Ufd1, which maps to human 22q11 and encodes a protein

involved in degradation of ubiquitinated proteins. Mouse Ufd1 was specifically expressed in most tissues affected in patients with the DiGeorge (22q11 deletion) syndrome. Yamagishi et al. (1999) found, furthermore, that the human UFD1L gene was deleted in all 182 patients studied with the 22q11 deletion, and a smaller deletion of approximately 20 kb that removed exons 1 to 3 of UFD1L was found in 1 individual with features typical of 22q11 deletion syndrome. In the individual with the smaller deletion, patient J.F., Yamagishi et al. (1999) found that the CDC45L gene (OMIM Ref. No. 603465), which is immediately telomeric of UFD1L, was the site of the deletion in the region between exons 5 and 6 of the 5-prime breakpoint. They considered that the deletion in CDC45L may act as a modifier of the phenotype in patient J.F. UFD1L and CDC45L are transcribed in opposite directions. The deletion left exons 4 to 12 of UFD1L intact; the first 5 exons of CDC45L were deleted. Patient J.F. had nearly all of the features commonly associated with the 2-Mb 22q11 deletion. Four days after birth the patient was diagnosed with interrupted aortic arch, persistent truncus arteriosus, cleft palate, small mouth, low-set ears, broad nasal bridge, neonatal hypocalcemia, T-lymphocyte deficiency,

and syndactyly of her toes. The deletion was not present in her parents or in 100 control subjects.

[8604] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8605] Pizutti, A.; Novelli, G.; Ratti, A.; Amati, F.; Mari, A.; Calabrese, G.; Nicolis, S.; Silani, V.; Marino, B.; Scarlato, G.; Ottolenghi, S.; Dallapiccola, B. : UFD1L, a developmentally expressed ubiquitination gene, is deleted in CATCH 22 syndrome. Hum. Molec. Genet. 6: 259–265, 1997. ; and

[8606] Yamagishi, H.; Garg, V.; Matsuoka, R.; Thomas, T.; Srivastava, D. : A molecular pathway revealing a genetic basis for human cardiac and craniofacial defects. Science 283: 1158–1161, 199.

[8607] Further studies establishing the function and utilities of UFD1L are found in John Hopkins OMIM database record ID 601754, and in cited publications numbered 6233–6234 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BANP (Accession XM_038696) is another VGAM87 host target gene. BANP BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BANP, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BANP BINDING SITE, designated SEQ ID:32911, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8608] Another function of VGAM87 is therefore inhibition of BANP (Accession XM_038696). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BANP. Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082) is another VGAM87 host target gene. C20orf59 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C20orf59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C20orf59 BINDING SITE, designated SEQ ID:22624, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8609] Another function of VGAM87 is therefore inhibition of Chromosome 20 Open Reading Frame 59 (C20orf59, Accession NM_022082). Accordingly, utilities of VGAM87 in-

clude diagnosis, prevention and treatment of diseases and clinical conditions associated with C20orf59. CLIPR-59 (Accession NM_015526) is another VGAM87 host target gene. CLIPR-59 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CLIPR-59, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLIPR-59 BINDING SITE, designated SEQ ID:17786, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8610] Another function of VGAM87 is therefore inhibition of CLIPR-59 (Accession NM_015526). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLIPR-59. FLJ10898 (Accession XM_002486) is another VGAM87 host target gene. FLJ10898 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ10898, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10898 BINDING SITE,

designated SEQ ID:29890, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8611] Another function of VGAM87 is therefore inhibition of FLJ10898 (Accession XM_002486). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10898. KIAA0350 (Accession XM_028332) is another VGAM87 host target gene. KIAA0350 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0350, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0350 BINDING SITE, designated SEQ ID:30664, to the nucleotide sequence of VGAM87 RNA, herein designated VGAM RNA, also designated SEQ ID:2798.

[8612] Another function of VGAM87 is therefore inhibition of KIAA0350 (Accession XM_028332). Accordingly, utilities of VGAM87 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0350. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 88 (VGAM88) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8613] VGAM88 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM88 was detected is described hereinabove with reference to Figs. 1–8.

[8614] VGAM88 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8615] VGAM88 gene encodes a VGAM88 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM88 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM88 precursor RNA is designated SEQ ID:74, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:74 is located at position 66710 relative to the genome of

Plutella Xylostella Granulovirus.

[8616] VGAM88 precursor RNA folds onto itself, forming VGAM88 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8617] An enzyme complex designated DICER COMPLEX, `dices` the VGAM88 folded precursor RNA into VGAM88 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM88 RNA is designated SEQ ID:2799, and is provided hereinbelow with reference to the sequence listing part.

[8618] VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA,

VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM88 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8619] VGAM88 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM88 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM88 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig.

1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8620] The complementary binding of VGAM88 RNA, herein designated VGAM RNA, to host target binding sites on VGAM88 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM88 host target RNA into VGAM88 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8621] It is appreciated that VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM88 host target genes. The mRNA of each one of this plurality of VGAM88 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM88 RNA, herein designated VGAM RNA, and which when bound by VGAM88 RNA causes inhibition of translation of respective one or more VGAM88 host target proteins.

[8622] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM88 gene, herein designated VGAM GENE, on one or more VGAM88 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8623] It is yet further appreciated that a function of VGAM88 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM88 correlate with, and may be deduced from, the identity of the host target genes which VGAM88 binds and

inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8624] Nucleotide sequences of the VGAM88 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM88 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM88 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM88 are further described hereinbelow with reference to Table 1.

[8625] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM88 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM88 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8626] As mentioned hereinabove with reference to Fig. 1, a function of VGAM88 gene, herein designated VGAM is inhibition of expression of VGAM88 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM88 correlate with, and may be deduced from, the identity of the target genes which VGAM88 binds and inhibits, and the function of these target genes, as elabo-

rated hereinbelow.

[8627] Actinin, Alpha 2 (ACTN2, Accession NM_001103) is a VGAM88 host target gene. ACTN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ACTN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ACTN2 BINDING SITE, designated SEQ ID:6759, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:2799.

[8628] A function of VGAM88 is therefore inhibition of Actinin, Alpha 2 (ACTN2, Accession NM_001103), a gene which an actin-binding protein with multiple roles in different cell types. Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ACTN2. The function of ACTN2 has been established by previous studies. Alpha-actinin is an actin-binding protein with multiple roles in different cell types. In nonmuscle cells, the cytoskeletal isoform is found along microfilament bundles and adherens-type junctions, where it is involved in binding actin to the membrane (see OMIM Ref. No. ACTN1; 102575). In con-

trast, skeletal, cardiac, and smooth muscle isoforms are localized to the Z-disc and analogous dense bodies, where they help anchor the myofibrillar actin filaments. Beggs et al. (1992) characterized 2 human muscle-specific alpha-actinin genes, ACTN2 and ACTN3 (OMIM Ref. No. 102574). Using somatic cell hybrids, Beggs et al. (1992) mapped the ACTN2 and ACTN3 genes to chromosomes 1 and 11, respectively. In situ hybridization placed the ACTN2 locus at 1q42-q43. Beggs et al. (1992) identified a polymorphic (CA)_n repeat within the ACTN2 gene and used it to position the ACTN2 gene on the CEPH linkage map of chromosome 1.

[8629] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8630] Beggs, A. H.; Byers, T. J.; Knoll, J. H. M.; Boyce, F. M.; Bruns, G. A. P.; Kunkel, L. M. : Cloning and characterization of two human skeletal muscle alpha-actinin genes located on chromosomes 1 and 11. J. Biol. Chem. 267: 9281-9288, 1992. ; and

[8631] Beggs, A. H.; Phillips, H. A.; Kozman, H.; Mulley, J. C.; Wilton, S. D.; Kunkel, L. M.; Laing, N. G. : A (CA)_n repeat polymorphism for the human skeletal muscle alpha-ac-

tinin gene ACTN2.

[8632] Further studies establishing the function and utilities of ACTN2 are found in John Hopkins OMIM database record ID 102573, and in cited publications numbered 4264–4266 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191) is another VGAM88 host target gene. C1orf22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C1orf22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C1orf22 BINDING SITE, designated SEQ ID:24840, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:2799.

[8633] Another function of VGAM88 is therefore inhibition of Chromosome 1 Open Reading Frame 22 (C1orf22, Accession NM_025191). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C1orf22. LOC114932 (Accession XM_052614) is another VGAM88 host target

gene. LOC114932 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC114932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC114932 BINDING SITE, designated SEQ ID:36004, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:2799.

[8634] Another function of VGAM88 is therefore inhibition of LOC114932 (Accession XM_052614). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC114932. LOC119369 (Accession XM_061434) is another VGAM88 host target gene. LOC119369 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC119369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119369 BINDING SITE, designated SEQ ID:37206, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:2799.

[8635] Another function of VGAM88 is therefore inhibition of LOC119369 (Accession XM_061434). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119369. LOC255533 (Accession XM_173073) is another VGAM88 host target gene. LOC255533 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255533, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255533 BINDING SITE, designated SEQ ID:46330, to the nucleotide sequence of VGAM88 RNA, herein designated VGAM RNA, also designated SEQ ID:2799.

[8636] Another function of VGAM88 is therefore inhibition of LOC255533 (Accession XM_173073). Accordingly, utilities of VGAM88 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255533. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 89 (VGAM89) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8637] VGAM89 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM89 was detected is described hereinabove with reference to Figs. 1–8.

[8638] VGAM89 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8639] VGAM89 gene encodes a VGAM89 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM89 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM89 precursor RNA is designated SEQ ID:75, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:75 is located at position 9283 relative to the genome of Plutella Xylostella Granulovirus.

[8640] VGAM89 precursor RNA folds onto itself, forming VGAM89 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8641] An enzyme complex designated DICER COMPLEX, `dices` the VGAM89 folded precursor RNA into VGAM89 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 80%) nucleotide sequence of VGAM89 RNA is designated SEQ ID:2800, and is provided hereinbelow with reference to the sequence listing part.

[8642] VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM89 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8643] VGAM89 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM89 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM89 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[8644] The complementary binding of VGAM89 RNA, herein designated VGAM RNA, to host target binding sites on VGAM89 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM89 host target RNA into VGAM89 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8645] It is appreciated that VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM89 host target genes. The mRNA of each one of this plurality of VGAM89 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM89 RNA, herein designated VGAM RNA, and which when bound by VGAM89 RNA causes inhibition of translation of respective one or more VGAM89 host target proteins.

[8646] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM89 gene, herein designated VGAM GENE, on one or

more VGAM89 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8647] It is yet further appreciated that a function of VGAM89 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM89 correlate with, and may be deduced from, the identity of the host target genes which VGAM89 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8648] Nucleotide sequences of the VGAM89 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM89 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM89 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM89 are further de-
scribed hereinbelow with reference to Table 1.

[8649] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM89 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM89 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8650] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM89 gene, herein designated VGAM is in-
hibition of expression of VGAM89 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM89 correlate with, and may be deduced from, the
identity of the target genes which VGAM89 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[8651] Inhibin, Beta C (INHBC, Accession NM_005538) is a
VGAM89 host target gene. INHBC BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by INHBC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of INHBC BINDING SITE, designated SEQ ID:12064, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:2800.

[8652] A function of VGAM89 is therefore inhibition of Inhibin, Beta C (INHBC, Accession NM_005538), a gene which inhibits the secretion of follitropin by the pituitary gland. Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with INHBC. The function of INHBC has been established by previous studies. Activins are homo- or heterodimers of related beta subunits (see OMIM Ref. No. 147290) while inhibins are dimers composed of an alpha subunit (OMIM Ref. No. 147380) and an activin beta subunit (summarized in Schmitt et al., 1996). These proteins belong to the TGF-beta superfamily (see OMIM Ref. No. 190180), the members of which have important roles in cell determination, differentiation, and growth. Members of the inhibin/activin subgroup were originally identified

by their opposing roles in the control of follicle-stimulating hormone (OMIM Ref. No. 118850) release by cultured pituitary cells (Ling et al., 1986). Activin ligands act as growth and differentiation factors in many cells and tissues. Mellor et al. (2000) examined the localization of and dimerization among activin subunits. The results demonstrated that activin beta-C can form dimers with activin beta-A and beta-B in vitro, but not with the inhibin alpha subunit. Using a specific antibody, activin beta-C protein was localized to human liver and prostate and colocalized with beta-A and beta-B subunits to specific cell types in benign and malignant prostate tissues. The capacity to form novel activin heterodimers (but not inhibin C) appears to reside in the human liver and prostate. The authors concluded that formation of activin AC or BC heterodimers may have significant implications in the regulation of levels and/or biologic activity of other activins in these tissues.

[8653] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

somal localization, and expression analysis of the mouse inhibin/activin betaC (Inhbc) gene. Genomics 32: 358–366, 1996. ; and

[8655] Mellor, S. L.; Cranfield, M.; Ries, R.; Pedersen, J.; Cancilla, B.; de Kretser, D.; Groome, N. P.; Mason, A. J.; Risbridger, G. P. : Localization of activin beta(A)–, beta(B)–, and beta(C)–.

[8656] Further studies establishing the function and utilities of INHBC are found in John Hopkins OMIM database record ID 601233, and in cited publications numbered 2834–283 and 5243 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pleiomorphic Adenoma Gene–like 1 (PLAGL1, Accession NM_002656) is another VGAM89 host target gene. PLAGL1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAGL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAGL1 BINDING SITE, designated SEQ ID:8530, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:2800.

[8657] Another function of VGAM89 is therefore inhibition of

Pleiomorphic Adenoma Gene-like 1 (PLAGL1, Accession NM_002656), a gene which regulates apoptosis and cell cycle arrest. Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAGL1. The function of PLAGL1 has been established by previous studies. Cell proliferation is regulated through connected molecular pathways controlling cell division, differentiation, growth arrest, and apoptosis. A tight control of these events is necessary to the maintenance of homeostasis from development to senescence and involves multiple genes. Dysregulation of some of these genes can lead to pathologic situations such as neurodegenerative disorders, immunodeficiency syndromes, and cancer. Early studies on tumor development focused on oncogenes, the genes whose gain of function leads to enhanced cell growth. The inactivation of a tumor suppressor gene, in contrast, can contribute to the growth deregulation of a tumor cell. This tumor suppressor gene inactivation can occur through a loss-of-function mutation accompanied by a loss of heterozygosity, homozygous deletion, or epigenetic mechanisms. Several lines of evidence suggest a tumor suppressor function to a candidate gene: involvement in familial

predisposition to cancer, inactivation in human tumors, tumor formation in null-mutant mice, and functional properties compatible with a role in cell proliferation or development. The candidates in which all of these criteria had been fulfilled include p53 (OMIM Ref. No. 191170), RB (OMIM Ref. No. 180200), p16 (OMIM Ref. No. 600160), and VHL (OMIM Ref. No. 193300). Spengler et al. (1997) isolated a novel mouse gene, designated Zac, which encodes a protein with 7 zinc fingers of the C2H2 type that is only distantly related to previously isolated zinc finger proteins and that inhibits tumor cell proliferation in vitro and in vivo in nude mice. They showed that these antiproliferative properties ensued from the regulation of 2 pathways critical to the activity of p53, i.e., cell cycle progression and apoptosis. Thus, mouse Zac was the first gene unrelated to p53 that was found to regulate these 2 fundamental genetic programs. The authors hypothesized that Zac also could share with p53 its tumor suppressor activity and isolated the human homolog of Zac to investigate its putative tumor suppressor function. They found that human ZAC is a widely expressed zinc finger protein that shows transactivation and DNA-binding activities. Furthermore, like its mouse counterpart and p53, ZAC in-

hibits tumor cell proliferation through the induction of both apoptosis and cell cycle arrest. Kamiya et al. (2000) described a screen for new imprinted human genes, and in this way identified the ZAC/PLAGL1 gene as a strong candidate for transient neonatal diabetes mellitus (TNDM; 601410). To screen for imprinted genes, they compared parthenogenetic DNA from a chimeric patient FD and androgenetic DNA from hydatidiform mole, using restriction landmark genome scanning for methylation. This resulted in identification of 2 novel imprinted loci, one of which (NV149) mapped to the TNDM region of 6q24. From analysis of the corresponding genomic region, it was determined that NV149 lies approximately 60 kb upstream of the ZAC/PLAGL1 gene. RT-PCR analysis was used to confirm that the ZAC/PLAGL1 gene is expressed only from the paternal allele in a variety of tissues. TNDM is known to result from upregulation of a paternally expressed gene on 6q24. Kamiya et al. (2000) pointed to the paternal expression, map position, and known biologic properties of ZAC/PLAGL1 as making it highly likely that it is the TNDM gene. In particular, ZAC/PLAGL1 is a transcriptional regulator of the type 1 receptor for pituitary adenylate cyclase-activating polypeptide (OMIM Ref. No. 102981), which is

the most potent known insulin secretagogue and an important mediator of autocrine control of insulin secretion in the pancreatic islet.

[8658] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8659] Spengler, D.; Villalba, M.; Hoffmann, A.; Pantaloni, C.; Houssami, S.; Bockaert, J.; Journot, L. : Regulation of apoptosis and cell cycle arrest by Zac1, a novel zinc finger protein expressed in the pituitary gland and the brain. EMBO J. 16: 2814–2825, 1997. ; and

[8660] Kamiya, M.; Judson, H.; Okazaki, Y.; Kusakabe, M.; Muramatsu, M.; Takada, S.; Takagi, N.; Arima, T.; Wake, N.; Kamimura, K.; Satomura, K.; Hermann, R.; Bonthron, D. T.; Hayashizaki, Y. :.

[8661] Further studies establishing the function and utilities of PLAGL1 are found in John Hopkins OMIM database record ID 603044, and in cited publications numbered 8651–8652, 7188, 8653–8647, 684 and 8648–8649 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZP434G1411 (Accession XM_166383) is another VGAM89 host target gene. DKFZP434G1411 BINDING SITE is HOST TARGET

binding site found in the 3' untranslated region of mRNA encoded by DKFZP434G1411, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434G1411 BINDING SITE, designated SEQ ID:44232, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:2800.

[8662] Another function of VGAM89 is therefore inhibition of DKFZP434G1411 (Accession XM_166383). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434G1411. LOC91409 (Accession XM_038298) is another VGAM89 host target gene. LOC91409 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91409, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91409 BINDING SITE, designated SEQ ID:32804, to the nucleotide sequence of VGAM89 RNA, herein designated VGAM RNA, also designated SEQ ID:2800.

[8663] Another function of VGAM89 is therefore inhibition of

LOC91409 (Accession XM_038298). Accordingly, utilities of VGAM89 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91409. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 90 (VGAM90) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8664] VGAM90 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM90 was detected is described hereinabove with reference to Figs. 1–8.

[8665] VGAM90 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8666] VGAM90 gene encodes a VGAM90 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM90 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM90 precursor RNA is designated SEQ ID:76, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:76 is located at position 15285 relative to the genome of *Plutella Xylostella Granulovirus*.

[8667] VGAM90 precursor RNA folds onto itself, forming VGAM90 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM90 folded precursor RNA into VGAM90 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide se-

quence of VGAM90 RNA is designated SEQ ID:2801, and is provided hereinbelow with reference to the sequence listing part.

[8669] VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM90 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8670] VGAM90 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM90 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustra-

tion only, and is not meant to be limiting – VGAM90 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8671] The complementary binding of VGAM90 RNA, herein designated VGAM RNA, to host target binding sites on VGAM90 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM90 host target RNA into VGAM90 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8672] It is appreciated that VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM90 host target genes. The mRNA of each one of this plurality of VGAM90 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM90 RNA, herein designated VGAM RNA, and which when bound by VGAM90 RNA causes inhibition of translation of respective one or more VGAM90 host target proteins.

- [8673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM90 gene, herein designated VGAM GENE, on one or more VGAM90 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
- [8674] It is yet further appreciated that a function of VGAM90 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM90 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM90 correlate with, and may be deduced from, the identity of the host target genes which VGAM90 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8675] Nucleotide sequences of the VGAM90 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM90 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM90 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM90 are further described hereinbelow with reference to Table 1.

[8676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM90 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM90 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM90 gene, herein designated VGAM is in-

hibition of expression of VGAM90 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM90 correlate with, and may be deduced from, the identity of the target genes which VGAM90 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8678] Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060) is a VGAM90 host target gene. ALDH3A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ALDH3A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH3A2 BINDING SITE, designated SEQ ID:34337, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8679] A function of VGAM90 is therefore inhibition of Aldehyde Dehydrogenase 3 Family, Member A2 (ALDH3A2, Accession XM_045060). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH3A2. Bone Morphogenetic Protein Receptor, Type IA (BMPR1A, Accession

NM_004329) is another VGAM90 host target gene.

BMPR1A BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by BMPR1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BMPR1A BINDING SITE, designated SEQ ID:10528, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8680] Another function of VGAM90 is therefore inhibition of Bone Morphogenetic Protein Receptor, Type IA (BMPR1A, Accession NM_004329). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BMPR1A. Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036) is another VGAM90 host target gene. ESM1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by ESM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ESM1 BINDING SITE, designated SEQ ID:13911, to the nu-

cleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8681] Another function of VGAM90 is therefore inhibition of Endothelial Cell-specific Molecule 1 (ESM1, Accession NM_007036). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ESM1. KIAA0408 (Accession NM_014702) is another VGAM90 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16234, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8682] Another function of VGAM90 is therefore inhibition of KIAA0408 (Accession NM_014702). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. LOC57117 (Accession NM_020395) is another VGAM90 host target gene. LOC57117 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC57117, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57117 BINDING SITE, designated SEQ ID:21664, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8683] Another function of VGAM90 is therefore inhibition of LOC57117 (Accession NM_020395). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57117. LOC91585 (Accession XM_039395) is another VGAM90 host target gene. LOC91585 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC91585, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91585 BINDING SITE, designated SEQ ID:33075, to the nucleotide sequence of VGAM90 RNA, herein designated VGAM RNA, also designated SEQ ID:2801.

[8684] Another function of VGAM90 is therefore inhibition of

LOC91585 (Accession XM_039395). Accordingly, utilities of VGAM90 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91585. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 91 (VGAM91) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8685] VGAM91 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM91 was detected is described hereinabove with reference to Figs. 1–8.

[8686] VGAM91 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8687] VGAM91 gene encodes a VGAM91 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM91 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM91 precursor RNA is designated SEQ ID:77, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:77 is located at position 20007 relative to the genome of *Plutella Xylostella Granulovirus*.

[8688] VGAM91 precursor RNA folds onto itself, forming VGAM91 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8689] An enzyme complex designated DICER COMPLEX, `dices` the VGAM91 folded precursor RNA into VGAM91 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide se-

quence of VGAM91 RNA is designated SEQ ID:2802, and is provided hereinbelow with reference to the sequence listing part.

[8690] VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM91 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8691] VGAM91 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM91 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustrative

tion only, and is not meant to be limiting – VGAM91 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8692] The complementary binding of VGAM91 RNA, herein designated VGAM RNA, to host target binding sites on VGAM91 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM91 host target RNA into VGAM91 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8693] It is appreciated that VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM91 host target genes. The mRNA of each one of this plurality of VGAM91 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM91 RNA, herein designated VGAM RNA, and which when bound by VGAM91 RNA causes inhibition of translation of respective one or more VGAM91 host target proteins.

- [8694] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM91 gene, herein designated VGAM GENE, on one or more VGAM91 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).
- [8695] It is yet further appreciated that a function of VGAM91 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly,

utilities of VGAM91 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM91 correlate with, and may be deduced from, the identity of the host target genes which VGAM91 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8696] Nucleotide sequences of the VGAM91 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM91 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM91 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM91 are further described hereinbelow with reference to Table 1.

[8697] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM91 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM91 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8698] As mentioned hereinabove with reference to Fig. 1, a function of VGAM91 gene, herein designated VGAM is in-

hibition of expression of VGAM91 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM91 correlate with, and may be deduced from, the identity of the target genes which VGAM91 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8699] Succinate Dehydrogenase Complex, Subunit D, Integral Membrane Protein (SDHD, Accession NM_003002) is a VGAM91 host target gene. SDHD BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SDHD, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SDHD BINDING SITE, designated SEQ ID:8898, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:2802.

[8700] A function of VGAM91 is therefore inhibition of Succinate Dehydrogenase Complex, Subunit D, Integral Membrane Protein (SDHD, Accession NM_003002). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SDHD. FLJ10324 (Accession NM_018059) is another

VGAM91 host target gene. FLJ10324 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ10324, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10324 BINDING SITE, designated SEQ ID:19828, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:2802.

[8701] Another function of VGAM91 is therefore inhibition of FLJ10324 (Accession NM_018059). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10324. LOC152876 (Accession XM_098279) is another VGAM91 host target gene. LOC152876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152876 BINDING SITE, designated SEQ ID:41560, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:2802.

[8702] Another function of VGAM91 is therefore inhibition of LOC152876 (Accession XM_098279). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152876. LOC221749 (Accession XM_166341) is another VGAM91 host target gene. LOC221749 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221749, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221749 BINDING SITE, designated SEQ ID:44178, to the nucleotide sequence of VGAM91 RNA, herein designated VGAM RNA, also designated SEQ ID:2802.

[8703] Another function of VGAM91 is therefore inhibition of LOC221749 (Accession XM_166341). Accordingly, utilities of VGAM91 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221749. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 92 (VGAM92) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8704] VGAM92 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM92 was detected is described hereinabove with reference to Figs. 1–8.

[8705] VGAM92 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8706] VGAM92 gene encodes a VGAM92 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM92 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM92 precursor RNA is designated SEQ ID:78, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:78 is located at position 54360 relative to the genome of Plutella Xylostella Granulovirus.

[8707] VGAM92 precursor RNA folds onto itself, forming VGAM92 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8708] An enzyme complex designated DICER COMPLEX, `dices` the VGAM92 folded precursor RNA into VGAM92 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 59%) nucleotide sequence of VGAM92 RNA is designated SEQ ID:2803, and is provided hereinbelow with reference to the sequence listing part.

[8709] VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM92 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8710] VGAM92 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM92 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM92 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[8711] The complementary binding of VGAM92 RNA, herein designated VGAM RNA, to host target binding sites on VGAM92 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM92 host target RNA into VGAM92 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8712] It is appreciated that VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM92 host target genes. The mRNA of each one of this plurality of VGAM92 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM92 RNA, herein designated VGAM RNA, and which when bound by VGAM92 RNA causes inhibition of translation of respective one or more VGAM92 host target proteins.

[8713] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM92 gene, herein designated VGAM GENE, on one or

more VGAM92 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8714] It is yet further appreciated that a function of VGAM92 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM92 correlate with, and may be deduced from, the identity of the host target genes which VGAM92 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8715] Nucleotide sequences of the VGAM92 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM92 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM92 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM92 are further de-
scribed hereinbelow with reference to Table 1.

[8716] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM92 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM92 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8717] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM92 gene, herein designated VGAM is in-
hibition of expression of VGAM92 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM92 correlate with, and may be deduced from, the
identity of the target genes which VGAM92 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[8718] KIAA1045 (Accession XM_048592) is a VGAM92 host tar-
get gene. KIAA1045 BINDING SITE is HOST TARGET bind-

ing site found in the 3' untranslated region of mRNA encoded by KIAA1045, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1045 BINDING SITE, designated SEQ ID:35193, to the nucleotide sequence of VGAM92 RNA, herein designated VGAM RNA, also designated SEQ ID:2803.

[8719] A function of VGAM92 is therefore inhibition of KIAA1045 (Accession XM_048592). Accordingly, utilities of VGAM92 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1045. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 93 (VGAM93) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8720] VGAM93 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM93 was detected is described hereinabove with reference to Figs. 1-8.

[8721] VGAM93 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Plutella Xylostella Granulovirus. VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8722] VGAM93 gene encodes a VGAM93 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM93 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM93 precursor RNA is designated SEQ ID:79, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:79 is located at position 88464 relative to the genome of Plutella Xylostella Granulovirus.

[8723] VGAM93 precursor RNA folds onto itself, forming VGAM93 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8724] An enzyme complex designated DICER COMPLEX, `dices` the VGAM93 folded precursor RNA into VGAM93 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM93 RNA is designated SEQ ID:2804, and is provided hereinbelow with reference to the sequence listing part.

[8725] VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM93 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8726] VGAM93 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM93 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM93 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8727] The complementary binding of VGAM93 RNA, herein designated VGAM RNA, to host target binding sites on VGAM93 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM93 host target RNA into VGAM93 host target protein, herein design-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8728] It is appreciated that VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM93 host target genes. The mRNA of each one of this plurality of VGAM93 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM93 RNA, herein designated VGAM RNA, and which when bound by VGAM93 RNA causes inhibition of translation of respective one or more VGAM93 host target proteins.

[8729] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM93 gene, herein designated VGAM GENE, on one or more VGAM93 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8730] It is yet further appreciated that a function of VGAM93 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM93 correlate with, and may be deduced from, the identity of the host target genes which VGAM93 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8731] Nucleotide sequences of the VGAM93 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM93 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM93 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM93 are further described hereinbelow with reference to Table 1.

[8732] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM93 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM93 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8733] As mentioned hereinabove with reference to Fig. 1, a function of VGAM93 gene, herein designated VGAM is inhibition of expression of VGAM93 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM93 correlate with, and may be deduced from, the identity of the target genes which VGAM93 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8734] Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712) is a VGAM93 host target gene. CEACAM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CEACAM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CEACAM1 BINDING SITE, designated SEQ ID:7440, to the nucleotide

sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8735] A function of VGAM93 is therefore inhibition of Carcinoembryonic Antigen-related Cell Adhesion Molecule 1 (biliary glycoprotein) (CEACAM1, Accession NM_001712), a gene which is a major effector of VEGF and may be a target for the inhibition of tumor angiogenesis. Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CEACAM1. The function of CEACAM1 has been established by previous studies. Ergun et al. (2000) showed that CEACAM1 exhibits angiogenic properties in in vitro and in vivo angiogenesis assays. CEACAM1 purified from granulocytes and endothelial cell media as well as recombinant CEACAM1 expressed in HEK293 cells stimulated proliferation, chemotaxis, and capillary-like tube formation of human microvascular endothelial cells. They increased vascularization of chick chorioallantoic membrane and potentiated the effects of VEGF165 (OMIM Ref. No. 192240). VEGF165 increased CEACAM1 expression at both the mRNA and the protein level. VEGF165-induced endothelial tube formation was blocked by a monoclonal CEACAM1 antibody. These data sug-

gested that CEACAM1 is a major effector of VEGF in the early microvessel formation. Since CEACAM1 is expressed in tumor microvessels but not in large blood vessels, CEACAM1 may be a target for the inhibition of tumor angiogenesis. Following infection with *Neisseria gonorrhoea*, there is a transient decline in circulating CD4 (OMIM Ref. No. 186940)-positive T lymphocytes that resolves after bacterial clearance. The gonococcus adheres to and is taken up by host cells through opacity-associated (Opa) proteins. Some Opa variants bind to heparan sulfate proteoglycans (HSPGs, e.g., SDC2; 142460), while others are specific for members of the CEACAM1/CD66 receptor family. CEACAM1 is the only member of this family that is expressed by lymphocytes and that contains a cytoplasmic ITIM (immunoreceptor tyrosine-based inhibitory motif). Using flow cytometry, Boulton and Gray-Owen (2002) demonstrated that CEACAM1 expression is upregulated after lymphocyte activation. Exposure to gonococci expressing the HSPG-specific Opa50 protein increased and exposure to CEACAM1-specific Opa52 gonococci or to anti-CEACAM1 antibody inhibited expression of the CD69 (OMIM Ref. No. 107273) activation marker on and proliferation by lymphocytes stimulated in vitro. The reduction

in lymphocyte proliferation was not due to an increase in cell death. CEACAM1 associated with Opa52 also interacted with SHP1 (OMIM Ref. No. 176883) and SHP2 (OMIM Ref. No. 176876), presumably through its cytoplasmic ITIM. Boulton and Gray-Owen (2002) suggested that Opa52 engagement of the CEACAM1 coinhibitory receptor induces immunosuppression and may explain the failure of the host to develop a memory humoral response to N. gonorrhea infection due to a lack of T-cell help for B-cell activation. Animal model experiments lend further support to the function of CEACAM1. Poy et al. (2002) hypothesized that insulin stimulates phosphorylation of CEACAM1 which in turn leads to upregulation of receptor-mediated insulin endocytosis and degradation in the hepatocyte. To test the hypothesis, they generated transgenic mice overexpressing in liver a dominant-negative phosphorylation-defective CEACAM1 mutant, S503A. Supporting their hypothesis, they found that S503A-CEACAM1 transgenic mice developed hyperinsulinemia resulting from impaired insulin clearance. The hyperinsulinemia caused secondary insulin resistance with impaired glucose tolerance and random, but not fasting, hyperglycemia. Transgenic mice developed visceral adiposity with in-

creased amounts of plasma free fatty acids and plasma and hepatic triglycerides. These findings suggested a mechanism through which insulin signaling regulates insulin sensitivity by modulating hepatic insulin clearance.

[8736] It is appreciated that the abovementioned animal model for CEACAM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications sited hereinbelow.

[8737] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8738] Ergun, S.; Kilic, N.; Ziegeler, G.; Hansen, A.; Nollau, P.; Gotze, J.; Wurmbach, J.-H.; Horst, A.; Weil, J.; Fernando, M.; Wagener, C. : CEA-related cell adhesion molecule 1: a potent angiogenic factor and a major effector of vascular endothelial growth factor. *Molec. Cell* 5: 311-320, 2000. ; and

[8739] Boulton, I. C.; Gray-Owen, S. D. : Neisserial binding to CEACAM1 arrests the activation and proliferation of CD4+ T lymphocytes. *Nature Immun.* 3: 229-236, 2002.

[8740] Further studies establishing the function and utilities of CEACAM1 are found in John Hopkins OMIM database record ID 109770, and in sited publications numbered

12145, 12146, 12147–12149, 10742, 12150–12151, 221, 10739–10740, 10743, 1215 and 10744 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Endometrial Bleeding Associated Factor (left–right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302) is another VGAM93 host target gene. EBAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:32607, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8741] Another function of VGAM93 is therefore inhibition of Endometrial Bleeding Associated Factor (left–right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302), a gene which LEFT–RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function of EBAF has been established by previous studies.

Because of the possibility that Lefty mutations may be associated with human L–R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical positions, and both genes encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty–1 or Lefty–2 of the mouse. Analysis of 126 human cases of L–R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine–knot region of the LEFTY A protein, and the phenotype of affected individuals was very similar to that typically seen in Lefty–1 –/– mice with L–R axis malformations. Because of the possibility

that Lefty mutations may be associated with human L–R axis malformations, Kosaki et al. (1999) characterized 2 human homologs, LEFTY A and LEFTY B (OMIM Ref. No. 603037). PCR screening of a PAC genomic library identified a clone that contained both LEFTY A and LEFTY B genes. Restriction mapping showed that the genes are separated by approximately 50 kb and are oriented in tandem. The 2 genes were localized by FISH to 1q42, a region syntenic to the location to which the mouse Lefty genes have been mapped at 1H5 (Meno et al., 1997). Both LEFTY A and LEFTY B contain 4 exons which are spliced at identical positions, and both genes encode proteins with 366 amino acids. LEFTY A was found to be identical to EBAF, the cDNA previously identified by Kothapalli et al. (1997). The deduced amino acid sequences of LEFTY A and LEFTY B are more similar to each other than to Lefty–1 or Lefty–2 of the mouse. Analysis of 126 human cases of L–R axis malformation showed 1 nonsense and 1 missense mutation in the LEFTY A gene. Both mutations lay in the cysteine–knot region of the LEFTY A protein, and the phenotype of affected individuals was very similar to that typically seen in Lefty–1 –/– mice with L–R axis malformations. Animal model experiments lend further support to

the function of EBAF. Lefty-1, lefty-2, and nodal (OMIM Ref. No. 601265) are expressed on the left side of developing mouse embryos and are implicated in L-R determination. Meno et al. (1998) examined the role of lefty-1 by analyzing mutant mice lacking this gene. The lefty-1-deficient mice showed a variety of L-R positional defects in visceral organs. The most common feature of lefty-1 -/- mice was thoracic left isomerism (rather than right isomerism). The lack of lefty-1 resulted in bilateral expression of nodal, lefty-2, and Pitx2 (OMIM Ref. No. 601542), a homeo box gene normally expressed on the left side. These observations suggested that the role of lefty-1 is to restrict the expression of lefty-2 and nodal to the left side, and that lefty-2 or nodal encode a signal for 'leftness.'

[8742] It is appreciated that the abovementioned animal model for EBAF is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8743] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8744] Kosaki, K.; Bassi, M. T.; Kosaki, R.; Lewin, M.; Belmont, J.;

Schauer, G.; Casey, B. : Characterization and mutation analysis of human LEFTY A and LEFTY B, homologues of murine genes implicated in left-right axis development. Am. J. Hum. Genet. 64: 712-721, 1999. ; and

[8745] Meno, C.; Shimonio, A.; Saijoh, Y.; Yashiro, K.; Mochida, K.; Ohishi, S.; Noji, S.; Kondoh, H.; Hamada, H. : Lefty-1 is required for left-right determination as a regulator of lefty-2 an.

[8746] Further studies establishing the function and utilities of EBAF are found in John Hopkins OMIM database record ID 601877, and in cited publications numbered 11847-1299 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Notch Homolog 2 (Drosophila) (NOTCH2, Accession NM_024408) is another VGAM93 host target gene. NOTCH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NOTCH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NOTCH2 BINDING SITE, designated SEQ ID:23648, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8747] Another function of VGAM93 is therefore inhibition of Notch Homolog 2 (*Drosophila*) (NOTCH2, Accession NM_024408), a gene which is moderately similar to a region of murine Notch1 and contains an ankyrin repeat. Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NOTCH2. The function of NOTCH2 has been established by previous studies. In *Drosophila*, the 'Notch' gene controls differentiation to various cell fates in many tissues. Three mammalian 'Notch' homologs have been identified. All 3 are very highly conserved relative to the *Drosophila* gene, which suggests that they are important for cell differentiation in mammals. This notion is supported by the previous finding of a truncated, translocated form of the human NOTCH1 (OMIM Ref. No. 190198) gene (formerly TAN1) in 3 cases of leukemia. Larsson et al. (1994) identified cosmid clones for all 3 human NOTCH genes. Using these clones as probes in fluorescence in situ hybridization to human metaphase chromosomes, they obtained results which, combined with data from somatic cell hybrid panels, demonstrated that NOTCH2 is located on 1p13-p11 and NOTCH3 on 19p13.2-p13.1, which are regions of neoplasia-associ-

ated translocation. As part of a study of a triplication of several Mb occurring on chromosomes 1, 6, and 9, Katsanis et al. (1996) confirmed the presence of a NOTCH locus on chromosome 1. Gao et al. (1998) mapped the mouse Notch2 gene to chromosome 3.

[8748] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8749] Katsanis, N.; Fitzgibbon, J.; Fisher, E. M. C. : Paralogy mapping: identification of a region in the human MHC triplicated onto human chromosomes 1 and 9 allows the prediction and isolation of novel PBX and NOTCH loci. Genomics 35: 101–108, 1996. ; and

[8750] Larsson, C.; Lardelli, M.; White, I.; Lendahl, U. : The human NOTCH1, 2, and 3 genes are located at chromosome positions 9q34, 1p13–p11, and 19p13.2–p13.1 in regions of neoplasia–associa.

[8751] Further studies establishing the function and utilities of NOTCH2 are found in John Hopkins OMIM database record ID 600275, and in cited publications numbered 841 and 10369 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0232 (Accession XM_052627) is another

VGAM93 host target gene. KIAA0232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0232 BINDING SITE, designated SEQ ID:36034, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8752] Another function of VGAM93 is therefore inhibition of KIAA0232 (Accession XM_052627). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0232. TU12B1-TY (Accession NM_016575) is another VGAM93 host target gene. TU12B1-TY BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TU12B1-TY, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TU12B1-TY BINDING SITE, designated SEQ ID:18645, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8753] Another function of VGAM93 is therefore inhibition of TU12B1-TY (Accession NM_016575). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TU12B1-TY. LOC90786 (Accession XM_034127) is another VGAM93 host target gene. LOC90786 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90786, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90786 BINDING SITE, designated SEQ ID:32012, to the nucleotide sequence of VGAM93 RNA, herein designated VGAM RNA, also designated SEQ ID:2804.

[8754] Another function of VGAM93 is therefore inhibition of LOC90786 (Accession XM_034127). Accordingly, utilities of VGAM93 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90786. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 94 (VGAM94) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8755] VGAM94 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM94 was detected is described hereinabove with reference to Figs. 1–8.

[8756] VGAM94 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8757] VGAM94 gene encodes a VGAM94 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM94 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM94 precursor RNA is designated SEQ ID:80, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:80 is located at position 54184 relative to the genome of Plutella Xylostella Granulovirus.

[8758] VGAM94 precursor RNA folds onto itself, forming VGAM94 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8759] An enzyme complex designated DICER COMPLEX, `dices` the VGAM94 folded precursor RNA into VGAM94 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM94 RNA is designated SEQ ID:2805, and is provided hereinbelow with reference to the sequence listing part.

[8760] VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM94 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8761] VGAM94 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM94 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM94 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[8762] The complementary binding of VGAM94 RNA, herein designated VGAM RNA, to host target binding sites on VGAM94 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM94 host target RNA into VGAM94 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8763] It is appreciated that VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM94 host target genes. The mRNA of each one of this plurality of VGAM94 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM94 RNA, herein designated VGAM RNA, and which when bound by VGAM94 RNA causes inhibition of translation of respective one or more VGAM94 host target proteins.

[8764] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM94 gene, herein designated VGAM GENE, on one or

more VGAM94 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8765] It is yet further appreciated that a function of VGAM94 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM94 correlate with, and may be deduced from, the identity of the host target genes which VGAM94 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8766] Nucleotide sequences of the VGAM94 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM94 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM94 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM94 are further de-
scribed hereinbelow with reference to Table 1.

[8767] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM94 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM94 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8768] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM94 gene, herein designated VGAM is in-
hibition of expression of VGAM94 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM94 correlate with, and may be deduced from, the
identity of the target genes which VGAM94 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[8769] BLAME (Accession NM_020125) is a VGAM94 host target
gene. BLAME BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by BLAME, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLAME BINDING SITE, designated SEQ ID:21309, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8770] A function of VGAM94 is therefore inhibition of BLAME (Accession NM_020125). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLAME. Chromosome 10 Open Reading Frame 2 (C10orf2, Accession NM_021830) is another VGAM94 host target gene. C10orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C10orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C10orf2 BINDING SITE, designated SEQ ID:22403, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8771] Another function of VGAM94 is therefore inhibition of Chromosome 10 Open Reading Frame 2 (C10orf2, Accession NM_021830). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C10orf2. Calcitonin Receptor (CALCR, Accession NM_001742) is another VGAM94 host target gene. CALCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CALCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CALCR BINDING SITE, designated SEQ ID:7478, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8772] Another function of VGAM94 is therefore inhibition of Calcitonin Receptor (CALCR, Accession NM_001742), a gene which is a receptor for calcitonin, is mediated by G proteins which activate adenylyl cyclase, and thought to couple to the heterotrimeric guanosine triphosphate-binding protein that is sensitive to cholera toxin. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CALCR. The function of CALCR has been established by previous studies. Taboulet et al. (1996) had reported the point mutation polymorphism (OMIM Ref. No. T to C) in the 3-prime region of the CALCR gene which induced a pro447-to-leu amino acid change in the third intracellular domain of the protein. This was the same mutation as that subsequently identified by Nakamura et al. (1997) and Masi et al. (1998) and referred to as pro463 to leu; the difference in numbering depended on whether isoform 1 or isoform 2 of the calcitonin receptor, with or without the 16-amino acid insert, was referred to (de Vernejoul, 1999). Taboulet et al. (1998) studied the distribution of these alleles in a cohort of 123 women with no osteoporotic fractures and 92 women who presented with one or more osteoporotic fractures of wrist or vertebrae. They found that bone mineral density of the femoral neck was significantly higher in heterozygous subjects compared with the homozygous leucine and homozygous proline genotypes. Also, a decreased fracture risk was observed in heterozygote subjects. In conclusion, they suggested that polymorphism of CALCR is associated with osteoporotic factors and bone mineral density in a population of post-menopausal women. The heterozygous advantage of the

pro/leu subjects could explain their protection against osteoporosis. The distribution of the CALCR alleles in the French population studied by Taboulet et al. (1998) was quite different from that observed by Nakamura et al. (1997) in the Japanese population. In Japan, the proline homozygote was the most frequent genotype (70%), Gorn et al. (1992) cloned a human calcitonin receptor cDNA from a eukaryotic expression library prepared from an ovarian small cell carcinoma cell line. A cell line had been shown to respond to calcitonin (CT, or CALCA; 114130) with increases in content of cellular cAMP. Transfection of this cDNA into COS cells resulted in expression of receptors with high affinity for salmon and human calcitonin. The expressed CALCR was coupled to adenylate cyclase. Northern analysis indicated a single transcript of about 4.2 kb. The cloned cDNA encoded a putative peptide of 490 amino acids with 7 potential transmembrane domains. The amino acid sequence was 73% identical to porcine CALCR, although the human CALCR contained an inset of 16 amino acids between transmembrane domains I and II. CALCR is closely related to the parathyroid hormone receptor (OMIM Ref. No. 168468) and the secretin receptor (OMIM Ref. No. 182098); these receptors com-

prise a distinct family of G protein-coupled 7-transmembrane domain receptors. A comparison of the human CALCR sequence to protein sequences in databases suggested that the receptor for calcitonin is evolutionarily related to the chemoattractant receptor of the primitive eukaryote *Dictyostelium discoideum*.

[8773] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8774] Gorn, A. H.; Lin, H. Y.; Yamin, M.; Auron, P. E.; Flannery, M. R.; Tapp, D. R.; Manning, C. A.; Lodish, H. F.; Krane, S. M.; Goldring, S. R. : Cloning, characterization, and expression of a human calcitonin receptor from an ovarian carcinoma cell line. *J. Clin. Invest.* 90: 1726-1735, 1992. ; and

[8775] Taboulet, J.; Frenkian, M.; Frendo, J. L.; Feingold, N.; Jullienne, A.; de Vernejoul, M. C. : Calcitonin receptor polymorphism is associated with a decreased fracture risk in post-menop.

[8776] Further studies establishing the function and utilities of CALCR are found in John Hopkins OMIM database record ID 114131, and in cited publications numbered 2336-2338, 3 and 12565-12570 listed in the bibliography section hereinbelow, which are also hereby incorpo-

rated by reference. Cytoplasmic Linker 2 (CYLN2, Accession NM_003388) is another VGAM94 host target gene. CYLN2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CYLN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CYLN2 BINDING SITE, designated SEQ ID:9421, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8777] Another function of VGAM94 is therefore inhibition of Cytoplasmic Linker 2 (CYLN2, Accession NM_003388), a gene which associates with microtubules and dendritic lamellar bodies. Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CYLN2. The function of CYLN2 has been established by previous studies. Cytoplasmic linker proteins have been proposed to mediate the interaction between specific membranous organelles and microtubules. Hoogenraad et al. (1998) isolated and characterized overlapping murine and human cosmid clones respectively containing the complete mouse *Cyln2* gene,

which encodes cytoplasmic linker protein-115 (Clip-115), and the partial human CYLN2 gene. Based on nucleotide sequence comparisons and hybridization data, they concluded that the human CYLN2 gene includes the incomplete WBSCR4 and WBSCR3 transcription units identified by Osborne et al. (1996). Hoogenraad et al. (1998) found that the human CYLN2 gene spans at least 140 kb of DNA. The deduced partial human CYLN2 protein contains an N-terminal globular region with 2 microtubule-binding domains, followed by a potential alpha-helical coiled-coils region. Northern blot analysis with a rat Cyln2 cDNA probe detected a 5.5-kb CYLN2 message in human adult brain. Using a gene targeting approach, Hoogenraad et al. (2002) provided evidence that mice with haploinsufficiency for Cyln2 have features reminiscent of WBS, including mild growth deficiency, brain abnormalities, hippocampal dysfunction, and particular deficits in motor coordination. Absence of CLIP115 also leads to increased levels of CLIP170 (OMIM Ref. No. 179830), a closely related cytoplasmic linker protein, and dynactin (DCTN1; 601143) at the tips of growing microtubules. This protein redistribution may affect dynein motor regulation and, together with the loss of CLIP115-specific functions, under-

lie neurologic alterations in WBS.

[8778] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8781] Further studies establishing the function and utilities of CYLN2 are found in John Hopkins OMIM database record ID 603432, and in cited publications numbered 5347, 998 and 10456 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Eukaryotic Translation Initiation Factor 5A2 (EIF5A2,

Accession NM_020390) is another VGAM94 host target gene. EIF5A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF5A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF5A2 BINDING SITE, designated SEQ ID:21660, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8782] Another function of VGAM94 is therefore inhibition of Eukaryotic Translation Initiation Factor 5A2 (EIF5A2, Accession NM_020390). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF5A2. Zuo1in Related Factor 1 (ZRF1, Accession XM_168590) is another VGAM94 host target gene. ZRF1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ZRF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZRF1 BINDING SITE, designated SEQ ID:45267, to the nucleotide sequence of

VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8783] Another function of VGAM94 is therefore inhibition of Zuotin Related Factor 1 (ZRF1, Accession XM_168590). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZRF1. Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM_019034) is another VGAM94 host target gene. ARHF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHF BINDING SITE, designated SEQ ID:21121, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8784] Another function of VGAM94 is therefore inhibition of Ras Homolog Gene Family, Member F (in filopodia) (ARHF, Accession NM_019034). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHF. FLJ13110 (Accession NM_022912) is another VGAM94 host target

gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23220, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8785] Another function of VGAM94 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. FLJ14146 (Accession NM_024709) is another VGAM94 host target gene. FLJ14146 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14146, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14146 BINDING SITE, designated SEQ ID:24034, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8786] Another function of VGAM94 is therefore inhibition of FLJ14146 (Accession NM_024709). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14146. KIAA0169 (Accession XM_052725) is another VGAM94 host target gene. KIAA0169 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0169 BINDING SITE, designated SEQ ID:36053, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8787] Another function of VGAM94 is therefore inhibition of KIAA0169 (Accession XM_052725). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0169. KIAA0864 (Accession XM_032630) is another VGAM94 host target gene. KIAA0864 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA0864, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0864 BINDING SITE, designated SEQ ID:31684, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8788] Another function of VGAM94 is therefore inhibition of KIAA0864 (Accession XM_032630). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0864. MGC15705 (Accession NM_032757) is another VGAM94 host target gene. MGC15705 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC15705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC15705 BINDING SITE, designated SEQ ID:26500, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8789] Another function of VGAM94 is therefore inhibition of MGC15705 (Accession NM_032757). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

MGC15705. p25 (Accession NM_007030) is another VGAM94 host target gene. p25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by p25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of p25 BINDING SITE, designated SEQ ID:13892, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8790] Another function of VGAM94 is therefore inhibition of p25 (Accession NM_007030). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with p25. Phytoceramide, Alkaline (PHCA, Accession NM_018367) is another VGAM94 host target gene. PHCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PHCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PHCA BINDING SITE, designated SEQ ID:20376, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2805.

[8791] Another function of VGAM94 is therefore inhibition of Phytoceramidase, Alkaline (PHCA, Accession NM_018367). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PHCA. Protein-O-mannosyltransferase 1 (POMT1, Accession NM_007171) is another VGAM94 host target gene. POMT1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by POMT1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POMT1 BINDING SITE, designated SEQ ID:14018, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8792] Another function of VGAM94 is therefore inhibition of Protein-O-mannosyltransferase 1 (POMT1, Accession NM_007171). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POMT1. LOC152925 (Accession XM_087559) is another VGAM94 host target gene. LOC152925 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by LOC152925, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152925 BINDING SITE, designated SEQ ID:39335, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8793] Another function of VGAM94 is therefore inhibition of LOC152925 (Accession XM_087559). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152925. LOC221463 (Accession XM_166374) is another VGAM94 host target gene. LOC221463 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221463 BINDING SITE, designated SEQ ID:44201, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8794] Another function of VGAM94 is therefore inhibition of

LOC221463 (Accession XM_166374). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221463. LOC254266 (Accession XM_173221) is another VGAM94 host target gene. LOC254266 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254266, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254266 BINDING SITE, designated SEQ ID:46481, to the nucleotide sequence of VGAM94 RNA, herein designated VGAM RNA, also designated SEQ ID:2805.

[8795] Another function of VGAM94 is therefore inhibition of LOC254266 (Accession XM_173221). Accordingly, utilities of VGAM94 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254266. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 95 (VGAM95) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[8796] VGAM95 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM95 was detected is described hereinabove with reference to Figs. 1–8.

[8797] VGAM95 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8798] VGAM95 gene encodes a VGAM95 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM95 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM95 precursor RNA is designated SEQ ID:81, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:81 is located at position 13652 relative to the genome of Plutella Xylostella Granulovirus.

[8799] VGAM95 precursor RNA folds onto itself, forming VGAM95 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin

structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8800] An enzyme complex designated DICER COMPLEX, `dices` the VGAM95 folded precursor RNA into VGAM95 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM95 RNA is designated SEQ ID:2806, and is provided hereinbelow with reference to the sequence listing part.

[8801] VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM95 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3`

untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8802] VGAM95 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM95 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM95 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8803] The complementary binding of VGAM95 RNA, herein designated VGAM RNA, to host target binding sites on VGAM95 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM95 host target RNA into VGAM95 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8804] It is appreciated that VGAM95 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM95 host target genes. The mRNA of each one of this plurality of VGAM95 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM95 RNA, herein designated VGAM RNA, and which when bound by VGAM95 RNA causes inhibition of translation of respective one or more VGAM95 host target proteins.

[8805] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM95 gene, herein designated VGAM GENE, on one or more VGAM95 host target gene, herein designated VGAM

HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8806] It is yet further appreciated that a function of VGAM95 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM95 correlate with, and may be deduced from, the identity of the host target genes which VGAM95 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8807] Nucleotide sequences of the VGAM95 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM95 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM95 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM95 are further described hereinbelow with reference to Table 1.

[8808] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM95 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM95 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8809] As mentioned hereinabove with reference to Fig. 1, a function of VGAM95 gene, herein designated VGAM is inhibition of expression of VGAM95 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM95 correlate with, and may be deduced from, the identity of the target genes which VGAM95 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8810] Calcium Channel, Voltage-dependent, Beta 2 Subunit (CACNB2, Accession NM_000724) is a VGAM95 host target gene. CACNB2 BINDING SITE is HOST TARGET binding site

found in the 5` untranslated region of mRNA encoded by CACNB2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNB2 BINDING SITE, designated SEQ ID:6388, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8811] A function of VGAM95 is therefore inhibition of Calcium Channel, Voltage-dependent, Beta 2 Subunit (CACNB2, Accession NM_000724). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNB2.

CD2-associated Protein (CD2AP, Accession NM_012120) is another VGAM95 host target gene. CD2AP BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CD2AP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CD2AP BINDING SITE, designated SEQ ID:14434, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8812] Another function of VGAM95 is therefore inhibition of CD2-associated Protein (CD2AP, Accession NM_012120), a gene which binds CAS ligand and may therefore involve in its growth regulatory pathway. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CD2AP. The function of CD2AP has been established by previous studies. P130(Cas) (OMIM Ref. No. 602941) is a docking protein that is tyrosine-phosphorylated in response to a variety of extracellular stimuli, such as growth factors, cell-cell interaction, and cell-matrix interaction, and appears to play a critical role in the integrin-linked formation of focal complexes. To understand the growth regulatory pathway of p130(Cas), Kirsch et al. (1999) used the yeast 2-hybrid system to search for interacting molecules. They identified a human protein, which they called CMS for p130(Cas) ligand with multiple SH3 domains, as a direct binding protein of p130(Cas). CMS is a multifunctional adapter-type molecule, which is localized in the cytoplasm, membrane ruffles, and leading edges of cells. Its structure and colocalization with F-actin (see OMIM Ref. No. 102610) and p130(Cas) suggested a function as a scaffolding protein involved in the dynamic regulation of

the actin cytoskeleton. The cDNA corresponding to CMS encodes a protein of 639 amino acids with a deduced molecular mass of approximately 70 kD. Amino acid analysis revealed that CMS contains in its N terminus 3 SH3 domains followed by a proline-rich region containing binding sites for SH3 domains. Putative actin-binding sites and a coiled-coil domain are located at the C terminus of the protein, which also contains a putative leucine zipper motif. CMS mRNA is ubiquitously expressed in adult and fetal human tissues as an approximately 5.4-kb transcript, as detected by Northern blot analysis. CMS induces vesicle formation and colocalizes with p130(Cas) and F-actin to membrane ruffles. It also associates with and is phosphorylated by tyrosine kinases. Kirsch et al. (1999) demonstrated that CMS is able to homodimerize through the coiled-coil domain located in its C terminus. There was no evidence for intermolecular or intramolecular binding via the SH3 domains and PXXP binding. Animal model experiments lend further support to the function of CD2AP. Shih et al. (1999) generated mice lacking CD2AP by targeted disruption. In CD2AP-deficient mice, immune function was compromised, but the mice died from renal failure at 6 to 7 weeks of age. In the kidney, CD2AP was

expressed primarily in glomerular epithelial cells. Knock-out mice exhibited defects in epithelial cell foot processes, accompanied by mesangial cell hyperplasia and extracellular matrix deposition. CD2AP associated with nephrin (OMIM Ref. No. 602716), which is the primary component of the slit diaphragm. This observation supports a role for CD2AP in this specialized cell junction.

[8813] It is appreciated that the abovementioned animal model for CD2AP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8814] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8815] Kirsch, K. H.; Georgescu, M.-M.; Ishimaru, S.; Hanafusa, H. : CMS: an adapter molecule involved in cytoskeletal rearrangements. Proc. Nat. Acad. Sci. 96: 6211-6216, 1999. ; and

[8816] Shih, N.-Y.; Li, J.; Karpitskii, V.; Nguyen, A.; Dustin, M. L.; Kanagawa, O.; Miner, J. H.; Shaw, A. S. : Congenital nephrotic syndrome in mice lacking CD2-associated protein. Science 2.

[8817] Further studies establishing the function and utilities of

CD2AP are found in John Hopkins OMIM database record ID 604241, and in cited publications numbered 5273–5275 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Exostoses (multiple)–like 3 (EXTL3, Accession NM_001440) is another VGAM95 host target gene. EXTL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EXTL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EXTL3 BINDING SITE, designated SEQ ID:7168, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8818] Another function of VGAM95 is therefore inhibition of Exostoses (multiple)–like 3 (EXTL3, Accession NM_001440), a gene which is a member of the multiple exostoses gene family. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EXTL3. The function of EXTL3 has been established by previous studies. By EST database searching with the sequences of EXT1 (OMIM Ref. No. 133700), EXT2 (OMIM Ref. No. 133701), and EXTL1 (OMIM

Ref. No. 601738), followed by 5-prime and 3-prime RACE, Saito et al. (1998) cloned full-length cDNAs for 2 new members of the EXT family, EXTL2 (OMIM Ref. No. 602411) and EXTL3, which they called EXTR2 and EXTR1, respectively. The deduced 919-amino acid EXTL3 protein contains a highly conserved region in the C terminus common to other EXT proteins. Northern blot analysis detected expression of 6.2- and 4.7-kb EXTR1 transcripts in all tissues tested except ovary. The larger transcript was predominant in brain, skeletal muscle, and testis, and the shorter transcript in heart, liver, thymus, and prostate. Kobayashi et al. (2000) isolated a cDNA for a REG protein (see OMIM Ref. No. 167770) receptor from a rat islet cDNA library. Cells into which the cDNA had been introduced bound REG protein with high affinity. When the cDNA was introduced into a pancreatic beta-cell line that showed REG-dependent growth, the transformants exhibited a significant increase in the incorporation of 5-prime-bromo-2-prime-deoxyuridine as well as in the cell numbers in response to REG protein. A homology search revealed that the rat REG protein receptor cDNA is a homolog of EXTL3. The rat and human proteins share 97% sequence identity. Kobayashi et al. (2000) found that

REG receptor mRNA in the rat is detectable in liver, kidney, stomach, small intestine, colon, adrenal gland, pituitary gland, and brain, but not in heart, suggesting the possible involvement of the REG-REG protein receptor signal system in a variety of cell types other than pancreatic beta cells. By somatic cell hybrid and radiation hybrid analyses, Saito et al. (1998) mapped the human EXTL3 gene to chromosome 8p21. By FISH, radiation hybrid analysis, and inclusion within a mapped contig, Van Hul et al. (1998) mapped the gene to 8p21-p12.

- [8820] Saito, T.; Seki, N.; Yamauchi, M.; Tsuji, S.; Hayashi, A.; Kozuma, S.; Hori, T. : Structure, chromosomal location, and expression profile of EXTR1 and EXTR2, new members of the multiple exostoses gene family. *Biochem. Biophys. Res. Commun.* 243: 61-66, 1998. ; and
- [8821] Van Hul, W.; Wuyts, W.; Hendrickx, J.; Speleman, F.; Wauters, J.; De Boulle, K.; Van Roy, N.; Bossuyt, P.; Willems, P. J. : Identification of a third EXT-like gene (EXTL3) belonging to.
- [8822] Further studies establishing the function and utilities of

EXTL3 are found in John Hopkins OMIM database record ID 605744, and in cited publications numbered 450 and 6016 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Muscleblind-like (Drosophila) (MBNL, Accession NM_021038) is another VGAM95 host target gene. MBNL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MBNL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBNL BINDING SITE, designated SEQ ID:22029, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8823] Another function of VGAM95 is therefore inhibition of Muscleblind-like (Drosophila) (MBNL, Accession NM_021038), a gene which binds to cug triplet repeat expansion dsrna (by similarity). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBNL. The function of MBNL has been established by previous studies. By screening for cDNAs with the potential to encode large proteins expressed in brain, Ishikawa et al.

(1997) identified a cDNA encoding MBNL, which they designated KIAA0428. KIAA0428 encodes a deduced 370-amino acid protein. RT-PCR analysis detected highest expression of KIAA0428 in skeletal muscle, followed by prostate, lung, heart, small intestine, ovary, and placenta. Triplet repeat expansion disorders (e.g., myotonic dystrophy; 160900) are characterized by genetic anticipation in which disease severity is proportional and age-of-onset is inversely proportional to the size of the expansion mutation. By biochemical purification of HeLa cell proteins binding to dystrophin myotonia (DM1) protein kinase (DMPK; 605377) RNAs with variable numbers of CUG repeats, followed by peptide sequence analysis and PCR, Miller et al. (2000) isolated cDNAs encoding isoforms of MBNL, which they termed EXP. The 42- and 40-kD isoforms, EXP42 and EXP40, are identical to a previously identified 388-amino acid MBNL protein (GenBank CAA74155) and KIAA0428, respectively, while the 35-kD isoform, EXP35, is a novel 305-amino acid protein. Northern blot analysis revealed 6.5- and 5.3-kb EXP transcripts that were highly expressed in cardiac and skeletal muscle. Western blot analysis showed high expression of EXP42 in HeLa and lymphoblastoid cell lines. Immunofluorescence

microscopy demonstrated nuclear and cytoplasmic expression of EXP42 in normal myoblasts, while nuclear foci were enriched in DM1 myoblasts. FISH and immunofluorescence analyses suggested that DMPK mutant RNAs recruit and sequester EXP dsRNA-binding proteins. Miller et al. (2000) proposed that the DM1 mutation produces a competing dsRNA-binding substrate that recruits the EXP proteins and sequesters them away from their normal RNA-binding sites during cell differentiation. By radiation hybrid analysis, Ishikawa et al. (1997) mapped the MBNL gene to chromosome 3. Miller et al. (2000) mapped the MBNL gene to 3q25, distal to the DM2 (OMIM Ref. No. 602668) and PROMM (OMIM Ref. No. 600109) loci on 3q21.

[8824] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8825] Miller, J. W.; Urbinati, C. R.; Teng-umnuay, P.; Stenberg, M. G.; Byrne, B. J.; Thornton, C. A.; Swanson, M. S. : Recruitment of human muscleblind proteins to (CUG)_n expansions associated with myotonic dystrophy. EMBO J. 19: 4439–4448, 2000. ; and

[8826] Ishikawa, K.; Nagase, T.; Nakajima, D.; Seki, N.; Ohira, M.;

Miyajima, N.; Tanaka, A.; Kotani, H.; Nomura, N.; Ohara, O. : Prediction of the coding sequences of unidentified human genes.

[8827] Further studies establishing the function and utilities of MBNL are found in John Hopkins OMIM database record ID 606516, and in cited publications numbered 627 and 8760 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mannosyl (alpha-1,3-)-glycoprotein Beta-1,4-N-acetylglucosaminyltransferase, Isoenzyme B (MGAT4B, Accession NM_054013) is another VGAM95 host target gene. MGAT4B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGAT4B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGAT4B BINDING SITE, designated SEQ ID:27621, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8828] Another function of VGAM95 is therefore inhibition of Mannosyl (alpha-1,3-)-glycoprotein Beta-1,4-N-acetylglucosaminyltransferase, Isoenzyme B

(MGAT4B, Accession NM_054013). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGAT4B. Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688) is another VGAM95 host target gene. NONO BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NONO, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NONO BINDING SITE, designated SEQ ID:39900, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8829] Another function of VGAM95 is therefore inhibition of Non-POU Domain Containing, Octamer-binding (NONO, Accession XM_088688), a gene which is a nuclear protein which contains RNA recognition motifs. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NONO. The function of NONO has been established by previous studies. Dong et al. (1993) purified and cloned the cDNA of HeLa cell p54nrb, a nuclear protein with 2

RNA recognition motifs and extensive homology to human splicing factor PSF and *Drosophila* NONA/BJ6. Brown et al. (1997) examined the expression of 33 X-linked genes in 8 mouse/human somatic cell hybrids that contained either the human active (3 hybrids) or inactive (5 hybrids) X chromosome. They found that the p54nrb gene was expressed only in those hybrids with the active human X. Using a megabase scale from pter to qter devised by Nelson et al. (1995), they noted that the approximate physical position of the gene was 70 Mb from pter. Brown et al. (1997) placed it in almost exactly the same position as the CCG1 gene (TAF2A; 313650), which had been mapped to Xq13-q27, and approximately 2 Mb proximal to PHKA1 (OMIM Ref. No. 311870), which had been mapped to Xq13. Thus, Xq13 is the likely location. The AFX1 gene (OMIM Ref. No. 300033) and the NRB54 gene map to a yeast artificial chromosome (YAC) contig of Xq13.1 that harbors the X-linked dystonia-parkinsonism locus DYT3 (OMIM Ref. No. 314250). Peters et al. (1997) found that the AFX1 gene is composed of 3 exons with most of exon 3 being untranslated. The NRB54 gene is made up of 12 exons ranging in size from 40 to 1,227 bp. The start codon is in exon 3 and the stop codon in exon 12. Both

genes are expressed in the brain, among other tissues.

Peters et al. (1997) excluded both genes as candidates of DYT3 by sequencing of the exons and the flanking intronic sequences in a patient and a control, and by Northern blot analysis.

[8830] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8831] Brown, C. J.; Carrel, L.; Willard, H. F. : Expression of genes from the human active and inactive X chromosomes. *Am. J. Hum. Genet.* 60: 1333–1343, 1997. ; and

[8832] Peters, U.; Haberhausen, G.; Kostrzewa, M.; Nolte, D.; Muller, U. : AFX1 and p54(nrb): fine mapping, genomic structure, and exclusion as candidate genes of X-linked dystonia parkinsonism.

[8833] Further studies establishing the function and utilities of NONO are found in John Hopkins OMIM database record ID 300084, and in cited publications numbered 10974–1097 and 8709 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pim-1 Oncogene (PIM1, Accession XM_165800) is another VGAM95 host target gene. PIM1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by PIM1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIM1 BINDING SITE, designated SEQ ID:43756, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8834] Another function of VGAM95 is therefore inhibition of Pim-1 Oncogene (PIM1, Accession XM_165800), a gene which is a protooncogene. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIM1. The function of PIM1 has been established by previous studies. Amson et al. (1989) showed that the 33-kD product of the PIM gene is highly expressed in the liver and spleen during fetal hematopoiesis. In contrast, it is only slightly expressed in circulating granulocytes in adults. It was over-expressed in hematopoietic malignancies, particularly in myeloid and lymphoid acute leukemias. The results implied a physiologic role of the PIM1 oncogene during hematopoietic development and a deregulation of the gene in various leukemias. Animal model experiments lend further support to the function of PIM1. To understand the

function of Pim1 and its role in hematopoietic development, Laird et al. (1993) generated mice deficient in Pim1 function. Pim1-deficient mice were ostensibly normal, healthy, and fertile; however, detailed analysis demonstrated a correlation of Pim1 deficiency with erythrocyte microcytosis, whereas overexpression of Pim1 in transgenic mice resulted in erythrocyte macrocytosis

[8835] It is appreciated that the abovementioned animal model for PIM1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8836] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8837] Laird, P. W.; van der Lugt, N. M. T.; Clarke, A.; Domen, J.; Linders, K.; McWhir, J.; Berns, A.; Hooper, M. : In vivo analysis of Pim-1 deficiency. *Nucleic Acids Res.* 21: 4750-4755, 1993. ; and

[8838] Amson, R.; Sigaux, F.; Przedborski, S.; Flandrin, G.; Givol, D.; Telerman, A. : The human protooncogene product p33pim is expressed during fetal hematopoiesis and in diverse leukemias. *Proc.*

[8839] Further studies establishing the function and utilities of

PIM1 are found in John Hopkins OMIM database record ID 164960, and in cited publications numbered 10810–10812, 1156 and 11115–11114 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Plasminogen Activator, Tissue (PLAT, Accession NM_000930) is another VGAM95 host target gene. PLAT BINDING SITE1 and PLAT BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PLAT, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAT BINDING SITE1 and PLAT BINDING SITE2, designated SEQ ID:6638 and SEQ ID:26897 respectively, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8840] Another function of VGAM95 is therefore inhibition of Plasminogen Activator, Tissue (PLAT, Accession NM_000930). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAT. Reticulocalbin 2, EF-hand Calcium Binding Domain (RCN2, Accession NM_002902) is another VGAM95 host target gene. RCN2

BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RCN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RCN2 BINDING SITE, designated SEQ ID:8805, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8841] Another function of VGAM95 is therefore inhibition of Reticulocalbin 2, EF-hand Calcium Binding Domain (RCN2, Accession NM_002902), a gene which binds calcium and interacts with papillomavirus E6 oncoprotein. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RCN2. The function of RCN2 has been established by previous studies. One major class of calcium-binding proteins is the EF-hand proteins, which includes calmodulin (see OMIM Ref. No. CALM1; 114180). Members of this family contain a helix-loop-helix motif, called the EF-hand, that coordinates calcium with high specificity. The endoplasmic reticulum (ER) is the major calcium storage compartment in nonmuscle eukaryotic cells. By screening a HeLa cell cDNA expression library with autoimmune

serum from a patient, Weis et al. (1994) cloned a human cDNA encoding an EF-hand protein, named RCN2. The predicted 317-amino acid RCN2 protein contains an N-terminal signal sequence, 6 copies of the EF-hand motif, and a C-terminal His-Asp-Glu-Leu (HDEL) sequence, which was originally defined as an ER retention motif in yeast proteins. Immunocytochemical localization and cell fractionation studies demonstrated that RCN2 is a resident ER protein; the HDEL motif is required for its ER retention. RCN2 was detected by antibodies in all cell lines tested. It binds calcium in vitro. By Western blotting, in vitro translated RCN2 protein has a molecular mass of 55 kD, leading the authors to designate it the 'endoplasmic reticulum calcium-binding protein of 55 kD' (ERC55). The RCN2 gene was assigned by a radiation hybrid panel to human chromosome 15, between D15S215 and D15S206 by Genethon, and between D15S114 and D15S1041 by the Stanford Human Genome Center (Schuler et al., 1996). By fluorescence in situ hybridization, Wang et al. (1997) mapped the RCN2 gene to 15q23. Because type 4 Bardet-Biedl syndrome (OMIM Ref. No. 600374) maps to this region, RCN2 may be implicated in the causation of that disorder.

- [8842] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [8843] Weis, K.; Griffiths, G.; Lamond, A. I. : The endoplasmic reticulum calcium-binding protein of 55 kDa is a novel EF-hand protein retained in the endoplasmic reticulum by a carboxyl-terminal His-Asp-Glu-Leu motif. *J. Biol. Chem.* 269: 19142-19150, 1994. ; and
- [8844] Wang, J. Y.; Zhen, D. K.; Bianchi, D. W.; Androphy, E. J.; Chen, J. J. : Assignment of the gene for ERC-55 (RCN2) to human chromosome band 15q22.33-q24.1 by in situ hybridization. *Cytog.*
- [8845] Further studies establishing the function and utilities of RCN2 are found in John Hopkins OMIM database record ID 602584, and in cited publications numbered 9044-904 and 12708-9047 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM_134324) is another VGAM95 host target gene. TARBP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TARBP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III.

Table 2 illustrates the complementarity of the nucleotide sequences of TARBP2 BINDING SITE, designated SEQ ID:28629, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8846] Another function of VGAM95 is therefore inhibition of TAR (HIV) RNA Binding Protein 2 (TARBP2, Accession NM_134324), a gene which is involved in the regulation of HIV replication. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TARBP2. The function of TARBP2 has been established by previous studies. By screening a HeLa cell cDNA library with a TAR RNA probe, Gatignol et al. (1991) purified a cDNA, TARBP2, encoding a 345-amino acid protein termed TRBP by the authors. Mutation analysis showed that the TARBP2 protein binds to the helix between the bulge and the loop of the TAR RNA. Functional analysis demonstrated that TARBP2 enhanced expression of the HIV-1 LTR 20- to 60-fold and that the transactivation required an intact TAR RNA structure. By sequence analysis, Kozak et al. (1995) determined that human and mouse TARBP2 genes are expressed as 1.6-kb transcripts. However, immunoblot analysis re-

vealed that TARBP2 encodes 90- and 37-kD proteins in mouse cells, a 37-kD protein in hamster cells, and a 55-kD protein in monkey and human cells.

[8847] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8848] Gatignol, A.; Buckler-White, A.; Berkhout, B.; Jeang, K. T. : Characterization of a human TAR RNA-binding protein that activates the HIV-1 LTR. *Science* 251: 1597-1600, 1991. ; and

[8849] Kozak, C. A.; Gatignol, A.; Graham, K.; Jeang, K. T.; McBride, O. W. : Genetic mapping in human and mouse of the locus encoding TRBP, a protein that binds the TAR region of the human i.

[8850] Further studies establishing the function and utilities of TARBP2 are found in John Hopkins OMIM database record ID 605053, and in cited publications numbered 5027-5029 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257) is another VGAM95 host target gene. TJP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TJP1, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TJP1 BINDING SITE, designated SEQ ID:9268, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8851] Another function of VGAM95 is therefore inhibition of Tight Junction Protein 1 (zona occludens 1) (TJP1, Accession NM_003257), a gene which colocalizes and interacts with cadherins in cells lacking tight junctions. Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TJP1. The function of TJP1 has been established by previous studies. Tight junction (zonula occludens) protein 1 (TJP1), also referred to as ZO-1, is a 200-kD protein located on a cytoplasmic membrane surface of vertebrate intercellular tight junctions. Willott et al. (1993) isolated a full-length cDNA sequence for human TJP1. Although the function of TJP1 is unknown, the cDNA sequence predicted a multi-domain signaling protein homologous to the product of the 'discs large-1' tumor suppressor gene of *Drosophila* (OMIM Ref. No. 601014) and several other membrane-associated proteins in mammals.

By fluorescence in situ hybridization using a cDNA probe, Mohandas et al. (1995) mapped TJP1 to 15q13. The Jackson Laboratory backcross DNA panel derived from interspecies crosses was used to map Tjp1 to mouse chromosome 7 in a region with conserved homology to 15q13. Fluorescence in situ hybridization studies on metaphases from patients with the Prader-Willi syndrome (OMIM Ref. No. 176270) and/or the Angelman syndrome (OMIM Ref. No. 105830) showed that TJP1 maps close but distal to the PWS/AS chromosome region.

[8852] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8853] Mohandas, T. K.; Chen, X.-N.; Rowe, L. B.; Birkenmeier, E. H.; Fanning, A. S.; Anderson, J. M.; Korenberg, J. R. : Localization of the tight junction protein gene TJP1 to human chromosome 15q13, distal to the Prader-Willi/Angelman region, and to mouse chromosome 7. *Genomics* 30: 594-597, 1995. ; and

[8854] Willott, E.; Balda, M. S.; Fanning, A. S.; Jameson, B.; Van Itallie, C.; Anderson, J. M. : The tight junction protein ZO-1 is homologous to the *Drosophila* discs-large tumor suppressor pr.

[8855] Further studies establishing the function and utilities of TJP1 are found in John Hopkins OMIM database record ID 601009, and in cited publications numbered 9454–9455 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185) is another VGAM95 host target gene. ARHGEF9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF9 BINDING SITE, designated SEQ ID:17542, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8856] Another function of VGAM95 is therefore inhibition of Cdc42 Guanine Nucleotide Exchange Factor (GEF) 9 (ARHGEF9, Accession NM_015185). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF9. BCMP1 (Accession NM_031442) is another VGAM95 host target gene. BCMP1 BINDING SITE is HOST

TARGET binding site found in the 3' untranslated region of mRNA encoded by BCMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BCMP1 BINDING SITE, designated SEQ ID:25457, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8857] Another function of VGAM95 is therefore inhibition of BCMP1 (Accession NM_031442). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BCMP1. Calmegin (CLGN, Accession NM_004362) is another VGAM95 host target gene. CLGN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CLGN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLGN BINDING SITE, designated SEQ ID:10570, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8858] Another function of VGAM95 is therefore inhibition of

Calmegin (CLGN, Accession NM_004362). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CLGN. CMG2 (Accession NM_058172) is another VGAM95 host target gene. CMG2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CMG2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CMG2 BINDING SITE, designated SEQ ID:27722, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8859] Another function of VGAM95 is therefore inhibition of CMG2 (Accession NM_058172). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CMG2. DKFZP434E2318 (Accession NM_032138) is another VGAM95 host target gene. DKFZP434E2318 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434E2318, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illus-

trates the complementarity of the nucleotide sequences of DKFZP434E2318 BINDING SITE, designated SEQ ID:25817, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8860] Another function of VGAM95 is therefore inhibition of DKFZP434E2318 (Accession NM_032138). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434E2318. DKFZp761D112 (Accession NM_032297) is another VGAM95 host target gene. DKFZp761D112 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761D112, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761D112 BINDING SITE, designated SEQ ID:26078, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8861] Another function of VGAM95 is therefore inhibition of DKFZp761D112 (Accession NM_032297). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

DKFZp761D112. FHR5 (Accession NM_030787) is another VGAM95 host target gene. FHR5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FHR5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FHR5 BINDING SITE, designated SEQ ID:25086, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8862] Another function of VGAM95 is therefore inhibition of FHR5 (Accession NM_030787). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FHR5. FLJ22390 (Accession NM_022746) is another VGAM95 host target gene. FLJ22390 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ22390, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22390 BINDING SITE, designated SEQ ID:22959, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2806.

[8863] Another function of VGAM95 is therefore inhibition of FLJ22390 (Accession NM_022746). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22390. FLJ31153 (Accession NM_144600) is another VGAM95 host target gene. FLJ31153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ31153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ31153 BINDING SITE, designated SEQ ID:29416, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8864] Another function of VGAM95 is therefore inhibition of FLJ31153 (Accession NM_144600). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ31153. Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM_033327) is another VGAM95 host target gene. FUBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by

FUBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FUBP3 BINDING SITE, designated SEQ ID:31875, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8865] Another function of VGAM95 is therefore inhibition of Far Upstream Element (FUSE) Binding Protein 3 (FUBP3, Accession XM_033327). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FUBP3. GTP Binding Protein 1 (GTPBP1, Accession NM_004286) is another VGAM95 host target gene. GTPBP1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by GTPBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTPBP1 BINDING SITE, designated SEQ ID:10498, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8866] Another function of VGAM95 is therefore inhibition of GTP

Binding Protein 1 (GTPBP1, Accession NM_004286). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTPBP1. KIAA0237 (Accession NM_014747) is another VGAM95 host target gene. KIAA0237 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0237 BINDING SITE, designated SEQ ID:16452, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8867] Another function of VGAM95 is therefore inhibition of KIAA0237 (Accession NM_014747). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0237. KIAA0420 (Accession XM_032693) is another VGAM95 host target gene. KIAA0420 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0420, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of KIAA0420 BINDING SITE, designated SEQ ID:31727, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8868] Another function of VGAM95 is therefore inhibition of KIAA0420 (Accession XM_032693). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0420. KIAA0483 (Accession NM_015176) is another VGAM95 host target gene. KIAA0483 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0483, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0483 BINDING SITE, designated SEQ ID:17530, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8869] Another function of VGAM95 is therefore inhibition of KIAA0483 (Accession NM_015176). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0483. KIAA0515 (Accession XM_033380) is another

VGAM95 host target gene. KIAA0515 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0515 BINDING SITE, designated SEQ ID:31927, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8870] Another function of VGAM95 is therefore inhibition of KIAA0515 (Accession XM_033380). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0515. KIAA0759 (Accession XM_041090) is another VGAM95 host target gene. KIAA0759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0759 BINDING SITE, designated SEQ ID:33443, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8871] Another function of VGAM95 is therefore inhibition of KIAA0759 (Accession XM_041090). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0759. KIAA1155 (Accession XM_030864) is another VGAM95 host target gene. KIAA1155 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1155 BINDING SITE, designated SEQ ID:31196, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8872] Another function of VGAM95 is therefore inhibition of KIAA1155 (Accession XM_030864). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1155. KIAA1449 (Accession NM_020839) is another VGAM95 host target gene. KIAA1449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1449, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1449 BINDING SITE, designated SEQ ID:21900, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8873] Another function of VGAM95 is therefore inhibition of KIAA1449 (Accession NM_020839). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1449. KIAA1656 (Accession XM_038022) is another VGAM95 host target gene. KIAA1656 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1656, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1656 BINDING SITE, designated SEQ ID:32735, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8874] Another function of VGAM95 is therefore inhibition of KIAA1656 (Accession XM_038022). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

KIAA1656. KIAA1735 (Accession XM_113686) is another VGAM95 host target gene. KIAA1735 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1735, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1735 BINDING SITE, designated SEQ ID:42346, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8875] Another function of VGAM95 is therefore inhibition of KIAA1735 (Accession XM_113686). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1735. KIAA1932 (Accession XM_055900) is another VGAM95 host target gene. KIAA1932 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1932, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1932 BINDING SITE, designated SEQ ID:36349, to the nucleotide sequence of VGAM95 RNA, herein designated

VGAM RNA, also designated SEQ ID:2806.

[8876] Another function of VGAM95 is therefore inhibition of KIAA1932 (Accession XM_055900). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1932. MAN1 (Accession NM_014319) is another VGAM95 host target gene. MAN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAN1 BINDING SITE, designated SEQ ID:15618, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8877] Another function of VGAM95 is therefore inhibition of MAN1 (Accession NM_014319). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAN1. MGC12966 (Accession NM_032706) is another VGAM95 host target gene. MGC12966 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC12966, corresponding to a HOST

TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC12966 BINDING SITE, designated SEQ ID:26421, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8878] Another function of VGAM95 is therefore inhibition of MGC12966 (Accession NM_032706). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC12966. MGC16063 (Accession NM_053047) is another VGAM95 host target gene. MGC16063 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16063 BINDING SITE, designated SEQ ID:27592, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8879] Another function of VGAM95 is therefore inhibition of MGC16063 (Accession NM_053047). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with MGC16063. Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580) is another VGAM95 host target gene. MKRN2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MKRN2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MKRN2 BINDING SITE, designated SEQ ID:35858, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8880] Another function of VGAM95 is therefore inhibition of Makorin, Ring Finger Protein, 2 (MKRN2, Accession XM_051580). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MKRN2. Phosphodiesterase 10A (PDE10A, Accession NM_006661) is another VGAM95 host target gene. PDE10A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PDE10A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of PDE10A BINDING SITE, designated SEQ ID:13462, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8881] Another function of VGAM95 is therefore inhibition of Phosphodiesterase 10A (PDE10A, Accession NM_006661). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE10A. Phosphodiesterase 7B (PDE7B, Accession NM_018945) is another VGAM95 host target gene. PDE7B BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PDE7B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE7B BINDING SITE, designated SEQ ID:21012, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8882] Another function of VGAM95 is therefore inhibition of Phosphodiesterase 7B (PDE7B, Accession NM_018945). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with PDE7B. Proline Rich 2 (PROL2, Accession NM_006813) is another VGAM95 host target gene. PROL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PROL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PROL2 BINDING SITE, designated SEQ ID:13685, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8883] Another function of VGAM95 is therefore inhibition of Proline Rich 2 (PROL2, Accession NM_006813). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PROL2. SSH2 (Accession XM_030846) is another VGAM95 host target gene. SSH2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SSH2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SSH2 BINDING SITE, designated SEQ ID:31185, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2806.

[8884] Another function of VGAM95 is therefore inhibition of SSH2 (Accession XM_030846). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SSH2. LOC122704 (Accession XM_058647) is another VGAM95 host target gene. LOC122704 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC122704, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC122704 BINDING SITE, designated SEQ ID:36693, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8885] Another function of VGAM95 is therefore inhibition of LOC122704 (Accession XM_058647). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC122704. LOC124944 (Accession XM_058876) is another VGAM95 host target gene. LOC124944 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC124944, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC124944 BINDING SITE, designated SEQ ID:36777, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8886] Another function of VGAM95 is therefore inhibition of LOC124944 (Accession XM_058876). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC124944. LOC143153 (Accession XM_084440) is another VGAM95 host target gene. LOC143153 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143153, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143153 BINDING SITE, designated SEQ ID:37580, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8887] Another function of VGAM95 is therefore inhibition of LOC143153 (Accession XM_084440). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC143153. LOC143154 (Accession XM_084441) is another VGAM95 host target gene. LOC143154 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC143154, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143154 BINDING SITE, designated SEQ ID:37587, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8888] Another function of VGAM95 is therefore inhibition of LOC143154 (Accession XM_084441). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143154. LOC144747 (Accession XM_084954) is another VGAM95 host target gene. LOC144747 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by LOC144747, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144747 BINDING SITE, designated SEQ ID:37784, to

the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8889] Another function of VGAM95 is therefore inhibition of LOC144747 (Accession XM_084954). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144747. LOC146515 (Accession XM_085493) is another VGAM95 host target gene. LOC146515 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146515, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146515 BINDING SITE, designated SEQ ID:38194, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8890] Another function of VGAM95 is therefore inhibition of LOC146515 (Accession XM_085493). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146515. LOC147658 (Accession XM_085827) is another VGAM95 host target gene. LOC147658 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC147658, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147658 BINDING SITE, designated SEQ ID:38354, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8891] Another function of VGAM95 is therefore inhibition of LOC147658 (Accession XM_085827). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147658. LOC149175 (Accession XM_086445) is another VGAM95 host target gene. LOC149175 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149175, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149175 BINDING SITE, designated SEQ ID:38662, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8892] Another function of VGAM95 is therefore inhibition of LOC149175 (Accession XM_086445). Accordingly, utilities

of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149175. LOC151178 (Accession XM_087117) is another VGAM95 host target gene. LOC151178 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC151178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC151178 BINDING SITE, designated SEQ ID:39072, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8893] Another function of VGAM95 is therefore inhibition of LOC151178 (Accession XM_087117). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC151178. LOC158156 (Accession XM_088496) is another VGAM95 host target gene. LOC158156 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC158156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC158156 BINDING SITE, designated SEQ ID:39743, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8894] Another function of VGAM95 is therefore inhibition of LOC158156 (Accession XM_088496). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158156. LOC158527 (Accession XM_088594) is another VGAM95 host target gene. LOC158527 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158527, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158527 BINDING SITE, designated SEQ ID:39863, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8895] Another function of VGAM95 is therefore inhibition of LOC158527 (Accession XM_088594). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158527. LOC165693 (Accession XM_093373) is another VGAM95 host target gene. LOC165693 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165693, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165693 BINDING SITE, designated SEQ ID:40188, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8896] Another function of VGAM95 is therefore inhibition of LOC165693 (Accession XM_093373). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165693. LOC168576 (Accession XM_095191) is another VGAM95 host target gene. LOC168576 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC168576, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC168576 BINDING SITE, designated SEQ ID:40255, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8897] Another function of VGAM95 is therefore inhibition of

LOC168576 (Accession XM_095191). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC168576. LOC200301 (Accession XM_114197) is another VGAM95 host target gene. LOC200301 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200301 BINDING SITE, designated SEQ ID:42782, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8898] Another function of VGAM95 is therefore inhibition of LOC200301 (Accession XM_114197). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200301. LOC203429 (Accession XM_114701) is another VGAM95 host target gene. LOC203429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC203429 BINDING SITE, designated SEQ ID:43051, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8899] Another function of VGAM95 is therefore inhibition of LOC203429 (Accession XM_114701). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203429. LOC219294 (Accession XM_167566) is another VGAM95 host target gene. LOC219294 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219294, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219294 BINDING SITE, designated SEQ ID:44688, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8900] Another function of VGAM95 is therefore inhibition of LOC219294 (Accession XM_167566). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219294. LOC219295 (Accession XM_167565) is an-

other VGAM95 host target gene. LOC219295 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219295, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219295 BINDING SITE, designated SEQ ID:44682, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8901] Another function of VGAM95 is therefore inhibition of LOC219295 (Accession XM_167565). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219295. LOC219401 (Accession XM_166706) is another VGAM95 host target gene. LOC219401 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219401, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219401 BINDING SITE, designated SEQ ID:44593, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8902] Another function of VGAM95 is therefore inhibition of LOC219401 (Accession XM_166706). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219401. LOC220705 (Accession XM_166000) is another VGAM95 host target gene. LOC220705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220705 BINDING SITE, designated SEQ ID:43835, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8903] Another function of VGAM95 is therefore inhibition of LOC220705 (Accession XM_166000). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220705. LOC221540 (Accession XM_168133) is another VGAM95 host target gene. LOC221540 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221540, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221540 BINDING SITE, designated SEQ ID:45045, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8904] Another function of VGAM95 is therefore inhibition of LOC221540 (Accession XM_168133). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221540. LOC221833 (Accession XM_166519) is another VGAM95 host target gene. LOC221833 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221833, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221833 BINDING SITE, designated SEQ ID:44457, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8905] Another function of VGAM95 is therefore inhibition of LOC221833 (Accession XM_166519). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC221833. LOC257354 (Accession XM_170810) is another VGAM95 host target gene. LOC257354 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257354, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257354 BINDING SITE, designated SEQ ID:45580, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8906] Another function of VGAM95 is therefore inhibition of LOC257354 (Accession XM_170810). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257354. LOC257545 (Accession XM_175217) is another VGAM95 host target gene. LOC257545 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257545, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257545 BINDING SITE, designated SEQ ID:46693, to the nucleotide sequence of VGAM95 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2806.

[8907] Another function of VGAM95 is therefore inhibition of LOC257545 (Accession XM_175217). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257545. LOC257598 (Accession XM_175295) is another VGAM95 host target gene. LOC257598 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257598, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257598 BINDING SITE, designated SEQ ID:46750, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8908] Another function of VGAM95 is therefore inhibition of LOC257598 (Accession XM_175295). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257598. LOC51580 (Accession NM_015874) is another VGAM95 host target gene. LOC51580 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC51580, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC51580 BINDING SITE, designated SEQ ID:18017, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8909] Another function of VGAM95 is therefore inhibition of LOC51580 (Accession NM_015874). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC51580. LOC90092 (Accession XM_028862) is another VGAM95 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30791, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8910] Another function of VGAM95 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC90092. LOC90133 (Accession XM_029323) is another VGAM95 host target gene. LOC90133 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90133, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90133 BINDING SITE, designated SEQ ID:30870, to the nucleotide sequence of VGAM95 RNA, herein designated VGAM RNA, also designated SEQ ID:2806.

[8911] Another function of VGAM95 is therefore inhibition of LOC90133 (Accession XM_029323). Accordingly, utilities of VGAM95 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90133. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 96 (VGAM96) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8912] VGAM96 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM96 was detected is described hereinabove with reference to Figs. 1–8.

[8913] VGAM96 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8914] VGAM96 gene encodes a VGAM96 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM96 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM96 precursor RNA is designated SEQ ID:82, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:82 is located at position 9897 relative to the genome of Plutella Xylostella Granulovirus.

[8915] VGAM96 precursor RNA folds onto itself, forming VGAM96 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is

due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8916] An enzyme complex designated DICER COMPLEX, `dices` the VGAM96 folded precursor RNA into VGAM96 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM96 RNA is designated SEQ ID:2807, and is provided hereinbelow with reference to the sequence listing part.

[8917] VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM96 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8918] VGAM96 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM96 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM96 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8919] The complementary binding of VGAM96 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM96 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM96 host target RNA into VGAM96 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8920] It is appreciated that VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM96 host target genes. The mRNA of each one of this plurality of VGAM96 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM96 RNA, herein designated VGAM RNA, and which when bound by VGAM96 RNA causes inhibition of translation of respective one or more VGAM96 host target proteins.

[8921] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM96 gene, herein designated VGAM GENE, on one or more VGAM96 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with

reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8922] It is yet further appreciated that a function of VGAM96 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM96 correlate with, and may be deduced from, the identity of the host target genes which VGAM96 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8923] Nucleotide sequences of the VGAM96 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM96 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of

VGAM96 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM96 are further described hereinbelow with reference to Table 1.

[8924] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM96 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM96 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8925] As mentioned hereinabove with reference to Fig. 1, a function of VGAM96 gene, herein designated VGAM is inhibition of expression of VGAM96 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM96 correlate with, and may be deduced from, the identity of the target genes which VGAM96 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8926] Angiotensin II Receptor, Type 1 (AGTR1, Accession NM_031850) is a VGAM96 host target gene. AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by AGTR1, corresponding to HOST TARGET bind-

ing sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AGTR1 BINDING SITE1 through AGTR1 BINDING SITE5, designated SEQ ID:25593, SEQ ID:6341, SEQ ID:11242, SEQ ID:14308 and SEQ ID:25768 respectively, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8927] A function of VGAM96 is therefore inhibition of Angiotensin II Receptor, Type 1 (AGTR1, Accession NM_031850), a gene which is an important effector controlling blood pressure and volume in the cardiovascular system. Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AGTR1. The function of AGTR1 has been established by previous studies. Angiotensin II (see OMIM Ref. No. 106150) is an important effector controlling blood pressure and volume in the cardiovascular system. Its importance is reflected by the efficacy of angiotensin-converting enzyme inhibitors in the treatment of hypertension and congestive heart failure. Angiotensin II interacts with 2 pharmacologically distinct subtypes of cell surface receptors, types 1 and 2 (AGTR2; 600350).

Type 1 receptors seem to mediate the major cardiovascular effects of angiotensin II. By expression cloning, Murphy et al. (1991) isolated a cDNA encoding the type 1 receptor. Hydropathic modeling of the deduced protein suggested that it shares the 7-transmembrane-region motif with the G protein-coupled receptor superfamily. Sasaki et al. (1991) isolated the corresponding bovine gene.

Takayanagi et al. (1992) cloned and sequenced a cDNA encoding this receptor in the human, and by Northern blot analysis they demonstrated its expression in human liver, lung, adrenal, and adrenocortical adenomas, but not in pheochromocytomas. Bergsma et al. (1992) and Mauzy et al. (1992) also cloned and characterized a human AGTR1 cDNA. Furuta et al. (1992) studied the genomic sequence and demonstrated that the coding region is contained in a single exon. By comparing genomic DNA and cDNA sequences, Guo et al. (1994) demonstrated that the AGTR1 gene consists of at least 5 exons and spans more than 55 kb of genomic DNA. The size of the exons ranges from 59 to 2,014 bp. Four of the exons encode 5-prime untranslated sequences. Multiple transcription initiation sites were observed by primer extension experiments. Pharmacologic agents that either block the formation of an-

angiotensin II or interrupt its action by antagonizing the AGT1–receptor are highly successful in the treatment of angiotensin II–dependent hypertension. Most notable among these agents is losartan, an AGT1–receptor antagonist that has been found to be an effective anti–hypertension drug without the usual side effects. This, coupled with the demonstration that polymorphism in the AGTR1 gene is associated with hypertension (Bonnardeaux et al., 1994), further supports the notion that the AGT1 receptor is an important target for the control of angiotensin II–dependent hypertension. In spite of the availability of excellent drugs for the control of hypertension, Iyer et al. (1996) explored the possibility that gene therapy could be used. They demonstrated that the delivery of angiotensin type 1 receptor antisense by a retrovirally–mediated delivery system resulted in a selective attenuation of the cellular actions of angiotensin II in the neurons of the spontaneously hypertensive (SH) rat model. A single injection normalized blood pressure in the SH rat on a long–term basis. The use of this approach in patients was proposed. Animal model experiments lend further support to the function of AGTR1. Oliverio et al. (1998) generated mice lacking AT1B (*Agtr1b* –/–) and other mice lacking

both AT1A and AT1B receptors. Agtr1b $-/-$ mice were healthy, without an abnormal phenotype. In contrast, mice who were homozygous for disruptions of both Agtr1a and Agtr1b had diminished growth, vascular thickening within the kidney, and atrophy of the inner renal medulla. This phenotype was virtually identical to that seen in angiotensinogen-deficient mice (see OMIM Ref. No. 106150) and in mice deficient in angiotensin-converting enzyme (OMIM Ref. No. 106180). The double knockout mice had no systemic pressor response to infusions of angiotensin II, but they responded normally to another vasoconstrictor, epinephrine. Blood pressure was reduced substantially in the double knockout mice, and following administration of an angiotensin-converting enzyme inhibitor, their blood pressure increased paradoxically.

[8928] It is appreciated that the abovementioned animal model for AGTR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[8929] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8932] Further studies establishing the function and utilities of AGTR1 are found in John Hopkins OMIM database record ID 106165, and in cited publications numbered 4238–4255, 4258–4257, 4259–426 and 4315–4317 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.FLJ10853 (Accession NM_018246) is another VGAM96 host target gene. FLJ10853 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10853, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10853 BINDING SITE, designated

SEQ ID:20210, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8933] Another function of VGAM96 is therefore inhibition of FLJ10853 (Accession NM_018246). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10853. KIAA0189 (Accession NM_014725) is another VGAM96 host target gene. KIAA0189 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0189, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0189 BINDING SITE, designated SEQ ID:16316, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8934] Another function of VGAM96 is therefore inhibition of KIAA0189 (Accession NM_014725). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0189. KIAA1100 (Accession NM_014901) is another VGAM96 host target gene. KIAA1100 BINDING SITE is

HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1100, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1100 BINDING SITE, designated SEQ ID:17085, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8935] Another function of VGAM96 is therefore inhibition of KIAA1100 (Accession NM_014901). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1100. Phosphodiesterase 8A (PDE8A, Accession XM_031443) is another VGAM96 host target gene. PDE8A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDE8A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDE8A BINDING SITE, designated SEQ ID:31378, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8936] Another function of VGAM96 is therefore inhibition of

Phosphodiesterase 8A (PDE8A, Accession XM_031443). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDE8A. LOC149832 (Accession XM_097733) is another VGAM96 host target gene.

LOC149832 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149832, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149832 BINDING SITE, designated SEQ ID:41077, to the nucleotide sequence of VGAM96 RNA, herein designated VGAM RNA, also designated SEQ ID:2807.

[8937] Another function of VGAM96 is therefore inhibition of LOC149832 (Accession XM_097733). Accordingly, utilities of VGAM96 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149832. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 97 (VGAM97) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[8938] VGAM97 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM97 was detected is described hereinabove with reference to Figs. 1–8.

[8939] VGAM97 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8940] VGAM97 gene encodes a VGAM97 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM97 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM97 precursor RNA is designated SEQ ID:83, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:83 is located at position 1601 relative to the genome of Plutella Xylostella Granulovirus.

[8941] VGAM97 precursor RNA folds onto itself, forming VGAM97 folded precursor RNA, herein designated VGAM FOLDED

PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8942] An enzyme complex designated DICER COMPLEX, `dices` the VGAM97 folded precursor RNA into VGAM97 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM97 RNA is designated SEQ ID:2808, and is provided hereinbelow with reference to the sequence listing part.

[8943] VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM97 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a

5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8944] VGAM97 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM97 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM97 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR

region, or in both 3`UTR and 5`UTR regions.

[8945] The complementary binding of VGAM97 RNA, herein designated VGAM RNA, to host target binding sites on VGAM97 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM97 host target RNA into VGAM97 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8946] It is appreciated that VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM97 host target genes. The mRNA of each one of this plurality of VGAM97 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM97 RNA, herein designated VGAM RNA, and which when bound by VGAM97 RNA causes inhibition of translation of respective one or more VGAM97 host target proteins.

[8947] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM97 gene, herein designated VGAM GENE, on one or

more VGAM97 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8948] It is yet further appreciated that a function of VGAM97 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM97 correlate with, and may be deduced from, the identity of the host target genes which VGAM97 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8949] Nucleotide sequences of the VGAM97 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM97 RNA, herein designated VGAM RNA, and
a schematic representation of the secondary folding of
VGAM97 folded precursor RNA, herein designated VGAM
FOLDED PRECURSOR RNA, of VGAM97 are further de-
scribed hereinbelow with reference to Table 1.

[8950] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM97 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM97 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[8951] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM97 gene, herein designated VGAM is in-
hibition of expression of VGAM97 target genes. It is ap-
preciated that specific functions, and accordingly utilities,
of VGAM97 correlate with, and may be deduced from, the
identity of the target genes which VGAM97 binds and in-
hibits, and the function of these target genes, as elabo-
rated hereinbelow.

[8952] FLJ11618 (Accession NM_022452) is a VGAM97 host tar-
get gene. FLJ11618 BINDING SITE is HOST TARGET binding

site found in the 3' untranslated region of mRNA encoded by FLJ11618, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11618 BINDING SITE, designated SEQ ID:22793, to the nucleotide sequence of VGAM97 RNA, herein designated VGAM RNA, also designated SEQ ID:2808.

[8953] A function of VGAM97 is therefore inhibition of FLJ11618 (Accession NM_022452). Accordingly, utilities of VGAM97 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11618. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 98 (VGAM98) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8954] VGAM98 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM98 was detected is described hereinabove with reference to Figs. 1–8.

[8955] VGAM98 gene, herein designated VGAM GENE, is a viral

gene contained in the genome of Plutella Xylostella Granulovirus. VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8956] VGAM98 gene encodes a VGAM98 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM98 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM98 precursor RNA is designated SEQ ID:84, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:84 is located at position 52717 relative to the genome of Plutella Xylostella Granulovirus.

[8957] VGAM98 precursor RNA folds onto itself, forming VGAM98 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8958] An enzyme complex designated DICER COMPLEX, `dices` the VGAM98 folded precursor RNA into VGAM98 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM98 RNA is designated SEQ ID:2809, and is provided hereinbelow with reference to the sequence listing part.

[8959] VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM98 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[8960] VGAM98 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. This com-

plementary binding is due to the fact that the nucleotide sequence of VGAM98 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM98 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[8961] The complementary binding of VGAM98 RNA, herein designated VGAM RNA, to host target binding sites on VGAM98 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM98 host target RNA into VGAM98 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8962] It is appreciated that VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM98 host target genes. The mRNA of each one of this plurality of VGAM98 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM98 RNA, herein designated VGAM RNA, and which when bound by VGAM98 RNA causes inhibition of translation of respective one or more VGAM98 host target proteins.

[8963] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM98 gene, herein designated VGAM GENE, on one or more VGAM98 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also

believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8964] It is yet further appreciated that a function of VGAM98 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM98 correlate with, and may be deduced from, the identity of the host target genes which VGAM98 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8965] Nucleotide sequences of the VGAM98 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM98 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM98 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM98 are further described hereinbelow with reference to Table 1.

[8966] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM98 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM98 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8967] As mentioned hereinabove with reference to Fig. 1, a function of VGAM98 gene, herein designated VGAM is inhibition of expression of VGAM98 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM98 correlate with, and may be deduced from, the identity of the target genes which VGAM98 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8968] Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755) is a VGAM98 host target gene. CBFB BINDING SITE1 and CBFB BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by CBFB, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CBFB BINDING SITE1 and CBFB BINDING SITE2, designated SEQ ID:7505 and SEQ ID:23146 respectively, to

the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8969] A function of VGAM98 is therefore inhibition of Core-binding Factor, Beta Subunit (CBFB, Accession NM_001755), a gene which is beta subunit of the transcription factor CBF which causes leukemia. Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFB. The function of CBFB has been established by previous studies. Liu et al. (1995) provided a review of leukemia pathogenesis related to CBFB. They suggested that it will be interesting to see whether variant fusions between CBFB and another gene exist as a result of translocation between 16q and another chromosome. The study of such variants might shed light on the mechanism of genesis by the inversion 16 fusion gene. Whether the abnormal eosinophils in the circulation in patients with inv(16) are part of the malignant cell population or a result of a secondary response could not be determined. Although the distribution of breakpoints in the introns of the 2 participating genes was heterogeneous, a surprisingly high incidence of breaks was observed in a small (OMIM Ref. No. 370 bp) intron of the MYH11 gene. CBFB

and AML1 encode the 2 subunits of the transcription factor CBF, and alterations of either one are associated with acute myeloid leukemia. CBFB is a transcription factor that does not bind DNA directly but interacts with the AML1 DNA-binding transcription factor (AML1) to increase its ability to bind DNA and regulate transcription. AML1 is one of the most frequently mutated genes in human leukemia. It is disrupted by the t(8;21), t(3;21), and t(16;21) in acute myeloid leukemia and by the t(12;21) in childhood B-cell acute lymphocytic leukemia (ALL). By disrupting CBFB, the inv(16) also disrupts AML1 functions. Together, these chromosomal rearrangements account for nearly one-quarter of all AML cases and one-fifth of all childhood B cell ALL-containing discernible chromosomal abnormalities. Lutterbach et al. (1999) showed that the inv(16) fusion protein cooperates with the largest form of AML1, termed AML-1B, to repress transcription. This cooperativity requires the ability of the translocation fusion protein to bind to AML-1B. Mutation analysis and cell fractionation experiments indicated that the inv(16) fusion protein acts in the nucleus and that repression occurs when the complex is bound to DNA. They demonstrated that the C-terminal portion of the inv(16) fusion protein

contains a repression domain, suggesting a molecular mechanism for AML1-mediated repression.

[8970] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[8971] Liu, P.; Tarle, S. A.; Hajra, A.; Claxton, D. F.; Marlton, P.; Freedman, M.; Siciliano, M. J.; Collins, F. S. : Fusion between transcription factor CBF-beta/PEBP2-beta and a myosin heavy chain in acute myeloid leukemia. Science 261: 1041-1044, 1993. ; and

[8972] Lutterbach, B.; Hou, Y.; Durst, K. L.; Hiebert, S. W. : The inv(16) encodes an acute myeloid leukemia 1 transcriptional corepressor. Proc. Nat. Acad. Sci. 96: 12822-12827, 1999.

[8973] Further studies establishing the function and utilities of CBFB are found in John Hopkins OMIM database record ID 121360, and in cited publications numbered 3402-3408 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sorting Nexin 9 (SNX9, Accession NM_016224) is another VGAM98 host target gene. SNX9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SNX9, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SNX9 BINDING SITE, designated SEQ ID:18329, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8974] Another function of VGAM98 is therefore inhibition of Sorting Nexin 9 (SNX9, Accession NM_016224). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SNX9. T-complex-associated-testis-expressed 1-like (TCTE1L, Accession XM_048205) is another VGAM98 host target gene. TCTE1L BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCTE1L, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCTE1L BINDING SITE, designated SEQ ID:35142, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8975] Another function of VGAM98 is therefore inhibition of T-complex-associated-testis-expressed 1-like (TCTE1L, Ac-

cession XM_048205). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCTE1L. Translin (TSN, Accession NM_004622) is another VGAM98 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10984, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8976] Another function of VGAM98 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TSN. The function of TSN has been established by previous studies. Kasai et al. (1994) identified a protein they termed recombination hotspot-associated factor (RCHF1), which specifically binds to the signal-like sequences at the breakpoint junction of 8q24 and 1p32 in acute lymphoblastic leukemia

(ALL) patients carrying t(8;14)(q24;q11) and t(1;14)(p32;q11) translocations involving the TCR delta-chain locus (TCRD; 186810). Aoki et al. (1994) showed that an analogous protein, which they designated BCLF1, specifically binds to a target sequence within the clustered breakpoint region of the BCL2 oncogene (OMIM Ref. No. 151430) in follicular lymphoma patients carrying t(14;18)(q32;q21) translocations. It was proposed that these binding activities at recombination hotspot regions may play a crucial role in chromosomal translocations in lymphoid neoplasms. Aoki et al. (1995) purified the BCLF1 protein to homogeneity and determined that it is identical to RCHF1. Molecular gene cloning experiments revealed that the purified protein, which they named translin (TSN), is a previously undescribed DNA-binding protein with no significant similarity to known proteins. (The designation 'translin' came from selected letters in 'translocation.')

In addition, Aoki et al. (1995) found that nuclear localization of translin was limited to lymphoid cell lines with rearranged Ig and processes such as DNA repair, replication, or recombination. In their native form, translin polypeptides form a multimeric structure that is responsible for its DNA binding activity. Aoki et al. (1997) found that the

human and mouse translin genes have identical genomic structures consisting of 6 exons, 5 introns, and a GC-rich upstream region. By in situ hybridization and analysis of somatic cell hybrids, Aoki et al. (1997) mapped the human TSN gene to 2q21.1. Badge et al. (2000) studied a sub-telomeric region at 16p13.3 that displays a 300-fold increase in crossovers compared to the genomic average rate. Segregation analysis of CEPH and other pedigrees yielded 6 paternal crossover breakpoints in the approximately 85-kb interval between the minisatellite loci D16S309 (MS205) and D16S83 (OMIM Ref. No. EKMDA2). Three crossovers were mapped to within the same small (less than 3 kb) interval, which did not colocalize with any tandem repeat array or expressed sequence. Sequence analysis revealed the presence of recombination-associated motifs and binding sites for translin. The authors concluded that this locus represents an intense male-specific recombination hotspot. Hosaka et al. (2000) demonstrated that the presence of the translin binding motif may be one of the important determinants for the location of breakpoints in the TLS (OMIM Ref. No. 137070) and CHOP (OMIM Ref. No. 126337) genes which are fused by translocation t(12;16) in liposarcomas.

- [8980] Further studies establishing the function and utilities of TSN are found in John Hopkins OMIM database record ID 600575, and in cited publications numbered 9536–953 and 9914–9917 listed in the bibliography section herein–below, which are also hereby incorporated by reference. NTT73 (Accession NM_018057) is another VGAM98 host target gene. NTT73 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NTT73, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NTT73 BINDING SITE, des–

ignated SEQ ID:19823, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8981] Another function of VGAM98 is therefore inhibition of NTT73 (Accession NM_018057). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NTT73. Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM_010230) is another VGAM98 host target gene. NUDT11 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NUDT11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NUDT11 BINDING SITE, designated SEQ ID:30145, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8982] Another function of VGAM98 is therefore inhibition of Nudix (nucleoside diphosphate linked moiety X)-type Motif 11 (NUDT11, Accession XM_010230). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

NUDT11. POPX1 (Accession NM_014906) is another VGAM98 host target gene. POPX1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by POPX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of POPX1 BINDING SITE, designated SEQ ID:17118, to the nucleotide sequence of VGAM98 RNA, herein designated VGAM RNA, also designated SEQ ID:2809.

[8983] Another function of VGAM98 is therefore inhibition of POPX1 (Accession NM_014906). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with POPX1. Tripartite Motif-containing 2 (TRIM2, Accession NM_015271) is another VGAM98 host target gene. TRIM2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TRIM2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM2 BINDING SITE, designated SEQ ID:17598, to the nucleotide sequence of VGAM98 RNA, herein designated

VGAM RNA, also designated SEQ ID:2809.

[8984] Another function of VGAM98 is therefore inhibition of Tripartite Motif-containing 2 (TRIM2, Accession NM_015271). Accordingly, utilities of VGAM98 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM2. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 99 (VGAM99) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[8985] VGAM99 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM99 was detected is described hereinabove with reference to Figs. 1–8.

[8986] VGAM99 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[8987] VGAM99 gene encodes a VGAM99 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM99 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM99 precursor RNA is designated SEQ ID:85, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:85 is located at position 37560 relative to the genome of *Plutella Xylostella Granulovirus*.

[8988] VGAM99 precursor RNA folds onto itself, forming VGAM99 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[8989] An enzyme complex designated DICER COMPLEX, `dices` the VGAM99 folded precursor RNA into VGAM99 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM99 RNA is designated SEQ ID:2810, and is provided hereinbelow with reference to the sequence listing part.

[8990] VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM99 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[8991] VGAM99 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM99 RNA is an accurate or a partial inverted-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III

respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM99 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[8992] The complementary binding of VGAM99 RNA, herein designated VGAM RNA, to host target binding sites on VGAM99 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM99 host target RNA into VGAM99 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[8993] It is appreciated that VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM99 host target genes. The mRNA of each one of this plurality of VGAM99 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM99 RNA, herein designated VGAM RNA, and which when bound by VGAM99 RNA causes inhibition of translation of respective one or more VGAM99 host target proteins.

[8994] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM99 gene, herein designated VGAM GENE, on one or more VGAM99 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[8995] It is yet further appreciated that a function of VGAM99 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM99 correlate with, and may be deduced from, the identity of the host target genes which VGAM99 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[8996] Nucleotide sequences of the VGAM99 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM99 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM99 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM99 are further described hereinbelow with reference to Table 1.

[8997] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM99 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM99 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[8998] As mentioned hereinabove with reference to Fig. 1, a function of VGAM99 gene, herein designated VGAM is inhibition of expression of VGAM99 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM99 correlate with, and may be deduced from, the identity of the target genes which VGAM99 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[8999] Translin (TSN, Accession NM_004622) is a VGAM99 host target gene. TSN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TSN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TSN BINDING SITE, designated SEQ ID:10985, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:2810.

[9000] A function of VGAM99 is therefore inhibition of Translin (TSN, Accession NM_004622), a gene which is a DNA binding protein and involved in DNA repair, replication, or recombination. Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with TSN. The function of TSN and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM98.KIAA1535 (Accession XM_086565) is another VGAM99 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38764, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:2810.

[9001] Another function of VGAM99 is therefore inhibition of KIAA1535 (Accession XM_086565). Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1535. NECL1 (Accession NM_021189) is another VGAM99 host target gene. NECL1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by NECL1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NECL1 BINDING SITE, designated SEQ ID:22163, to the nucleotide sequence of VGAM99 RNA, herein designated VGAM RNA, also designated SEQ ID:2810.

[9002] Another function of VGAM99 is therefore inhibition of NECL1 (Accession NM_021189). Accordingly, utilities of VGAM99 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NECL1. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 100 (VGAM100) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9003] VGAM100 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM100 was detected is described hereinabove with reference to Figs. 1–8.

[9004] VGAM100 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in

the human genome.

[9005] VGAM100 gene encodes a VGAM100 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM100 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM100 precursor RNA is designated SEQ ID:86, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:86 is located at position 61363 relative to the genome of *Plutella Xylostella Granulovirus*.

[9006] VGAM100 precursor RNA folds onto itself, forming VGAM100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9007] An enzyme complex designated DICER COMPLEX, `dices` the VGAM100 folded precursor RNA into VGAM100 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 48%) nucleotide sequence of VGAM100 RNA is designated SEQ ID:2811, and is provided hereinbelow with reference to the sequence listing part.

[9008] VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM100 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9009] VGAM100 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM100 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM100 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9010] The complementary binding of VGAM100 RNA, herein designated VGAM RNA, to host target binding sites on VGAM100 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM100 host target RNA into VGAM100 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9011] It is appreciated that VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM100 host target genes. The mRNA of each one of this plurality of VGAM100 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM100 RNA, herein designated VGAM RNA, and which when bound by VGAM100 RNA causes inhibition of translation of respective one or more VGAM100 host target proteins.

[9012] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM100 gene, herein designated VGAM GENE, on one or more VGAM100 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9013] It is yet further appreciated that a function of VGAM100 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM100 correlate with, and may be deduced from, the identity of the host target genes which VGAM100 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9014] Nucleotide sequences of the VGAM100 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM100 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM100 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM100 are further described hereinbelow with reference to Table 1.

[9015] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of

Fig. 1, found on VGAM100 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM100 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9016] As mentioned hereinabove with reference to Fig. 1, a function of VGAM100 gene, herein designated VGAM is inhibition of expression of VGAM100 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM100 correlate with, and may be deduced from, the identity of the target genes which VGAM100 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9017] Nuclear Factor I/B (NFIB, Accession NM_005596) is a VGAM100 host target gene. NFIB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFIB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFIB BINDING SITE, designated SEQ ID:12120, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:2811.

[9018] A function of VGAM100 is therefore inhibition of Nuclear Factor I/B (NFIB, Accession NM_005596), a gene which recognizes and binds the palindromic sequence 5'- ttggc-nnnnngccaa-3' present in viral and cellular promoters. Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFIB. The function of NFIB has been established by previous studies. See nuclear factor I/A (NFIA; 600727). Qian et al. (1995) mapped the NFIB gene to chromosome 9p24.1 by fluorescence in situ hybridization. Approximately 12% of all pleomorphic adenomas of the salivary glands are characterized by chromosome aberrations involving 12q13-q15. Several chromosomes have been found as translocation partners of chromosome 12, and some of these are recurrent. The target gene on 12q13-q15 involved in the translocation is HMGIC (OMIM Ref. No. 600698). Fusion partner genes include LPP (OMIM Ref. No. 600700) on 3q, ALDH2 (OMIM Ref. No. 100650) on 12q24.1, and FHIT (OMIM Ref. No. 601153) on 3p. Using 3-prime-RACE analysis of a primary adenoma with an apparently normal karyotype, Geurts et al. (1998) found an HMGIC fusion transcript containing ectopic sequences derived from the NFIB gene. In a second adenoma with an

ins(9;12)(p23;q12q15) as the sole anomaly, they also found an HMGIC/NFIB hybrid transcript. Nucleotide sequence analysis of the fusion transcripts indicated that the genetic aberration in both tumors resulted in the replacement of a carboxy-terminal segment of HMGIC by the last 5 amino acids of NFIB

[9019] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9020] Geurts, J. M. W.; Schoenmakers, E. F. P. M.; Roijer, E.; Astrom, A.-K.; Stenman, G.; van de Ven, W. J. M. : Identification of NFIB as recurrent translocation partner gene of HMGIC in pleomorphic adenomas. *Oncogene* 16: 865-872, 1998. ; and

[9021] Qian, F.; Kruse, U.; Lichter, P.; Sippel, A. E. : Chromosomal localization of the four genes (NFIA, B, C, and X) for the human transcription factor nuclear factor I by FISH. *Genomics* 28.

[9022] Further studies establishing the function and utilities of NFIB are found in John Hopkins OMIM database record ID 600728, and in cited publications numbered 7133 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DKFZp434J0617

(Accession NM_032246) is another VGAM100 host target gene. DKFZp434J0617 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp434J0617, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp434J0617 BINDING SITE, designated SEQ ID:25980, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:2811.

[9023] Another function of VGAM100 is therefore inhibition of DKFZp434J0617 (Accession NM_032246). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp434J0617. LCE (Accession NM_024090) is another VGAM100 host target gene. LCE BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LCE, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LCE BINDING SITE, designated SEQ ID:23532, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA,

also designated SEQ ID:2811.

[9024] Another function of VGAM100 is therefore inhibition of LCE (Accession NM_024090). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LCE. mPA-PLA1 (Accession NM_139248) is another VGAM100 host target gene. mPA-PLA1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by mPA-PLA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of mPA-PLA1 BINDING SITE, designated SEQ ID:29249, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:2811.

[9025] Another function of VGAM100 is therefore inhibition of mPA-PLA1 (Accession NM_139248). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with mPA-PLA1. LOC158629 (Accession XM_098972) is another VGAM100 host target gene. LOC158629 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC158629, corresponding

to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC158629 BINDING SITE, designated SEQ ID:42018, to the nucleotide sequence of VGAM100 RNA, herein designated VGAM RNA, also designated SEQ ID:2811.

[9026] Another function of VGAM100 is therefore inhibition of LOC158629 (Accession XM_098972). Accordingly, utilities of VGAM100 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC158629. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 101 (VGAM101) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9027] VGAM101 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM101 was detected is described hereinabove with reference to Figs. 1–8.

[9028] VGAM101 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Plutella Xylostella* Gran-

ulovirus. VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9029] VGAM101 gene encodes a VGAM101 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM101 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM101 precursor RNA is designated SEQ ID:87, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:87 is located at position 22037 relative to the genome of Plutella Xylostella Granulovirus.

[9030] VGAM101 precursor RNA folds onto itself, forming VGAM101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9031] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM101 folded precursor RNA into VGAM101 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM101 RNA is designated SEQ ID:2812, and is provided hereinbelow with reference to the sequence listing part.

[9032] VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM101 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9033] VGAM101 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM101 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM101 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9034] The complementary binding of VGAM101 RNA, herein designated VGAM RNA, to host target binding sites on VGAM101 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM101 host target RNA into VGAM101 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9035] It is appreciated that VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM101 host target genes. The mRNA of each one of this plurality of VGAM101 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM101 RNA, herein designated VGAM RNA, and which when bound by VGAM101 RNA causes inhibition of translation of respective one or more VGAM101 host target proteins.

[9036] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM101 gene, herein designated VGAM GENE, on one or more VGAM101 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9037] It is yet further appreciated that a function of VGAM101 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM101 correlate with, and may be deduced from, the identity of the host target genes which VGAM101 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9038] Nucleotide sequences of the VGAM101 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM101 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM101 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM101 are further described hereinbelow with reference to Table 1.

[9039] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM101 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM101 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9040] As mentioned hereinabove with reference to Fig. 1, a function of VGAM101 gene, herein designated VGAM is inhibition of expression of VGAM101 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM101 correlate with, and may be deduced from, the identity of the target genes which VGAM101 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9041] Ferrochelatase (protoporphyrin) (FECH, Accession NM_000140) is a VGAM101 host target gene. FECH BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FECH, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FECH BINDING SITE, designated SEQ ID:5636, to the nucleotide

sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9042] A function of VGAM101 is therefore inhibition of Ferrochelatase (protoporphyrinogen oxidase) (FECH, Accession NM_000140). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FECH. Heparan Sulfate (glucosamine) 3-O-sulfotransferase 2 (HS3ST2, Accession NM_006043) is another VGAM101 host target gene. HS3ST2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HS3ST2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HS3ST2 BINDING SITE, designated SEQ ID:12680, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9043] Another function of VGAM101 is therefore inhibition of Heparan Sulfate (glucosamine) 3-O-sulfotransferase 2 (HS3ST2, Accession NM_006043), a gene which plays a role in the generation of heparan sulfate proteoglycan. Accordingly, utilities of VGAM101 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with HS3ST2. The function of HS3ST2 has been established by previous studies. By searching an EST database for sequences related to the sulfotransferase domain of 3OST1, Shworak et al. (1999) identified partial cDNAs from the 3OST2, 3OST3A1 (OMIM Ref. No. 604057), and 3OST4 (OMIM Ref. No. 604059) genes. They used the partial cDNAs as probes and recovered additional clones corresponding to these genes and to 3OST3B1 (OMIM Ref. No. 604058). The 3OST2 gene encodes a predicted 367-amino acid protein that, like 3OST3A1 and 3OST3B1, is a predicted type II integral membrane protein. These 3 enzymes contain a positively charged N-terminal domain, a transmembrane domain, a region termed the SPLAG domain because it is rich in serine, proline, leucine, alanine, and glycine, and a C-terminal putative sulfotransferase domain. Although they share a similar regional structure, the only significant sequence homology between these 3OST proteins occurs in the sulfotransferase domains. Northern blot analysis revealed that the 3OST2 and 3OST4 genes were expressed predominantly in brain, while the 3OST3 gene exhibited more widespread expression. In a companion paper, Liu et al.

(1999) demonstrated that the 3OST1, 3OST2, and 3OST3 isoforms each generate unique 3-O-sulfated structures. Shworak et al. (1999) stated that the isoforms with different sulfotransferase domains differentially place the rare 3-O-sulfate group in distinct sequence contexts, presumably to regulate discrete biologic activities. This capacity of the sulfotransferase domain to generate distinct sequences may in turn be modulated by the unique N-terminal domains of the proteins. By inclusion within mapped clones, Shworak et al. (1999) mapped the 3OST2 gene to 16p12, near the 3OST4 gene at 16p11.2. Using interspecific backcross analysis, they mapped the mouse 3Ost2 and 3Ost4 genes to the distal region of chromosome 7, in a region sharing homology of synteny with human chromosome 16p.

[9044] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9045] Liu, J.; Shworak, N. W.; Sinay, P.; Schwartz, J. J.; Zhang, L.; Fritze, L. M.; Rosenberg, R. D. : Expression of heparan sulfate D-glucosaminyl 3-O-sulfotransferase isoforms reveals novel substrate specificities. J. Biol. Chem. 274: 5185-5192, 1999. ; and

[9046] Shworak, N. W.; Liu, J.; Petros, L. M.; Zhang, L.; Kobayashi, M.; Copeland, N. G.; Jenkins, N. A.; Rosenberg, R. D. : Multiple isoforms of heparan sulfate D-glucosaminyl 3-O-sulfotransf.

[9047] Further studies establishing the function and utilities of HS3ST2 are found in John Hopkins OMIM database record ID 604056, and in cited publications numbered 5054–5055 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. 5'-nucleotidase, Cytosolic II (NT5C2, Accession NM_012229) is another VGAM101 host target gene. NT5C2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NT5C2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NT5C2 BINDING SITE, designated SEQ ID:14524, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9048] Another function of VGAM101 is therefore inhibition of 5'-nucleotidase, Cytosolic II (NT5C2, Accession NM_012229). Accordingly, utilities of VGAM101 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NT5C2. Nuclear RNA Export Factor 5 (NXF5, Accession NM_033153) is another VGAM101 host target gene. NXF5 BINDING SITE1 and NXF5 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by NXF5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NXF5 BINDING SITE1 and NXF5 BINDING SITE2, designated SEQ ID:27006 and SEQ ID:27007 respectively, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9049] Another function of VGAM101 is therefore inhibition of Nuclear RNA Export Factor 5 (NXF5, Accession NM_033153). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NXF5. Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_002713) is another VGAM101 host target gene. PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPP1R8, corresponding to HOST

TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R8 BINDING SITE1 through PPP1R8 BINDING SITE3, designated SEQ ID:8570, SEQ ID:15340 and SEQ ID:28856 respectively, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9050] Another function of VGAM101 is therefore inhibition of Protein Phosphatase 1, Regulatory (inhibitor) Subunit 8 (PPP1R8, Accession NM_002713), a gene which is an inhibitor subunit of the major nuclear protein phosphatase-1 (pp-1). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R8. The function of PPP1R8 has been established by previous studies. In *Escherichia coli*, the *rne* gene encodes RNase E, a protein involved in RNA degradation. Wang and Cohen (1994) cloned a human gene, which they called ARD1 for 'activator of RNA decay,' that is able to complement mutations in the *E. coli rne* gene. The human ARD1 gene encodes a proline-rich 127-amino acid protein with a predicted mass of 13.3 kD. Wang and Cohen (1994) showed that human ARD1 protein is able to produce RNase E-specific

cleavages in *E. coli*. Van Eynde et al. (1995) cloned the bovine NIPP1 gene. The 351-amino acid NIPP1 protein is a specific inhibitor of type 1 serine/threonine protein phosphatases. The human ARD1 amino acid sequence is virtually identical to the carboxy terminus of the bovine NIPP1 amino acid sequence. Because the homology also extends into noncoding regions, the authors asserted that the NIPP1 and ARD1 proteins are alternately spliced products of the same gene. Claverie-Martin et al. (1997) purified human ARD1 protein and found that its apparent size was 19 kD. They attributed the observed retarded mobility on SDS-PAGE to the highly charged residues at the ends of the protein. Enzyme assays showed that ARD1, like RNase E, is Mg^{2+} dependent and that ARD1 and RNase E cleave RNA at the same sites in A+U-rich regions. Wang (1995) showed that the common 3-prime untranslated region of ARD1 and NIPP1 maps to human chromosome

[9051] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9052] Claverie-Martin, F.; Wang, M.; Cohen, S. N. : ARD-1 cDNA from human cells encodes a site-specific single-strand endoribonuclease that functionally resembles *Escherichia*

coli RNase E. J. Biol. Chem. 272: 13823–13828, 1997. ;
and

[9053] Van Eynde, A.; Wera, S.; Beullens, M.; Torrekens, S.; Van Leuven, F.; Stalmans, W.; Bollen, M. : Molecular cloning of NIPP–1, a nuclear inhibitor of protein phosphatase–1, reveals homolo.

[9054] Further studies establishing the function and utilities of PPP1R8 are found in John Hopkins OMIM database record ID 602636, and in cited publications numbered 8753–875 and 8941–8942 listed in the bibliography section herein–below, which are also hereby incorporated by reference.FLJ10178 (Accession NM_018015) is another VGAM101 host target gene. FLJ10178 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10178, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10178 BINDING SITE, designated SEQ ID:19754, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9055] Another function of VGAM101 is therefore inhibition of FLJ10178 (Accession NM_018015). Accordingly, utilities of

VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10178. Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571) is another VGAM101 host target gene. HEYL BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HEYL, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HEYL BINDING SITE, designated SEQ ID:15932, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9056] Another function of VGAM101 is therefore inhibition of Hairy/enhancer-of-split Related with YRPW Motif-like (HEYL, Accession NM_014571). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HEYL. KIAA0173 (Accession NM_014640) is another VGAM101 host target gene. KIAA0173 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0173, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0173 BINDING SITE, designated SEQ ID:16042, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9057] Another function of VGAM101 is therefore inhibition of KIAA0173 (Accession NM_014640). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0173. Nucleosomal Binding Protein 1 (NSBP1, Accession NM_030763) is another VGAM101 host target gene. NSBP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NSBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NSBP1 BINDING SITE, designated SEQ ID:25045, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9058] Another function of VGAM101 is therefore inhibition of Nucleosomal Binding Protein 1 (NSBP1, Accession NM_030763). Accordingly, utilities of VGAM101 include

diagnosis, prevention and treatment of diseases and clinical conditions associated with NSBP1. PRO1257 (Accession NM_018578) is another VGAM101 host target gene.

PRO1257 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO1257, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1257 BINDING SITE, designated SEQ ID:20657, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9059] Another function of VGAM101 is therefore inhibition of PRO1257 (Accession NM_018578). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1257. Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353) is another VGAM101 host target gene. ZDHHC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZDHHC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of ZDHHC2 BINDING SITE, designated SEQ ID:18492, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9060] Another function of VGAM101 is therefore inhibition of Zinc Finger, DHHC Domain Containing 2 (ZDHHC2, Accession NM_016353). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZDHHC2. LOC118851 (Accession XM_061180) is another VGAM101 host target gene. LOC118851 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC118851, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118851 BINDING SITE, designated SEQ ID:37204, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9061] Another function of VGAM101 is therefore inhibition of LOC118851 (Accession XM_061180). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC118851. LOC145813 (Accession XM_096873) is another VGAM101 host target gene. LOC145813 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145813, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145813 BINDING SITE, designated SEQ ID:40597, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9062] Another function of VGAM101 is therefore inhibition of LOC145813 (Accession XM_096873). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145813. LOC220565 (Accession XM_165417) is another VGAM101 host target gene. LOC220565 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220565, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220565 BINDING SITE, designated SEQ ID:43630, to the nucleotide sequence of VGAM101 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2812.

[9063] Another function of VGAM101 is therefore inhibition of LOC220565 (Accession XM_165417). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220565. LOC85414 (Accession NM_033102) is another VGAM101 host target gene. LOC85414 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC85414, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC85414 BINDING SITE, designated SEQ ID:26953, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9064] Another function of VGAM101 is therefore inhibition of LOC85414 (Accession NM_033102). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC85414. LOC90141 (Accession XM_029373) is another VGAM101 host target gene. LOC90141 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90141, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90141 BINDING SITE, designated SEQ ID:30882, to the nucleotide sequence of VGAM101 RNA, herein designated VGAM RNA, also designated SEQ ID:2812.

[9065] Another function of VGAM101 is therefore inhibition of LOC90141 (Accession XM_029373). Accordingly, utilities of VGAM101 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90141. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 102 (VGAM102) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9066] VGAM102 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM102 was detected is described hereinabove with reference to Figs. 1–8.

[9067] VGAM102 gene, herein designated VGAM GENE, is a viral gene contained in the genome of *Plutella Xylostella* Gran-

ulovirus. VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9068] VGAM102 gene encodes a VGAM102 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM102 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM102 precursor RNA is designated SEQ ID:88, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:88 is located at position 99184 relative to the genome of Plutella Xylostella Granulovirus.

[9069] VGAM102 precursor RNA folds onto itself, forming VGAM102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9070] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM102 folded precursor RNA into VGAM102 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM102 RNA is designated SEQ ID:2813, and is provided hereinbelow with reference to the sequence listing part.

[9071] VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM102 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9072] VGAM102 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM102 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM102 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9073] The complementary binding of VGAM102 RNA, herein designated VGAM RNA, to host target binding sites on VGAM102 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM102 host target RNA into VGAM102 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9074] It is appreciated that VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM102 host target genes. The mRNA of each one of this plurality of VGAM102 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM102 RNA, herein designated VGAM RNA, and which when bound by VGAM102 RNA causes inhibition of translation of respective one or more VGAM102 host target proteins.

[9075] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM102 gene, herein designated VGAM GENE, on one or more VGAM102 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9076] It is yet further appreciated that a function of VGAM102 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM102 correlate with, and may be deduced from, the identity of the host target genes which VGAM102 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9077] Nucleotide sequences of the VGAM102 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM102 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM102 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM102 are further described hereinbelow with reference to Table 1.

[9078] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM102 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM102 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9079] As mentioned hereinabove with reference to Fig. 1, a function of VGAM102 gene, herein designated VGAM is inhibition of expression of VGAM102 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM102 correlate with, and may be deduced from, the identity of the target genes which VGAM102 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9080] Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175) is a VGAM102 host target gene. C8orf2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf2 BINDING SITE, designated SEQ ID:14020, to the

nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:2813.

[9081] A function of VGAM102 is therefore inhibition of Chromosome 8 Open Reading Frame 2 (C8orf2, Accession NM_007175). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf2. Potassium Channel, Subfamily K, Member 13 (KCNK13, Accession NM_022054) is another VGAM102 host target gene. KCNK13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNK13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNK13 BINDING SITE, designated SEQ ID:22592, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:2813.

[9082] Another function of VGAM102 is therefore inhibition of Potassium Channel, Subfamily K, Member 13 (KCNK13, Accession NM_022054). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNK13. START Domain Containing 7 (STARD7, Accession NM_020151) is

another VGAM102 host target gene. STARD7 BINDING SITE1 and STARD7 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by STARD7, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of STARD7 BINDING SITE1 and STARD7 BINDING SITE2, designated SEQ ID:21355 and SEQ ID:29259 respectively, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:2813.

[9083] Another function of VGAM102 is therefore inhibition of START Domain Containing 7 (STARD7, Accession NM_020151). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STARD7. LOC57107 (Accession NM_020381) is another VGAM102 host target gene. LOC57107 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57107, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57107 BINDING SITE, desig-

nated SEQ ID:21648, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:2813.

[9084] Another function of VGAM102 is therefore inhibition of LOC57107 (Accession NM_020381). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57107. LOC90643 (Accession XM_033145) is another VGAM102 host target gene. LOC90643 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90643, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90643 BINDING SITE, designated SEQ ID:31852, to the nucleotide sequence of VGAM102 RNA, herein designated VGAM RNA, also designated SEQ ID:2813.

[9085] Another function of VGAM102 is therefore inhibition of LOC90643 (Accession XM_033145). Accordingly, utilities of VGAM102 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90643. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 103 (VGAM103) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9086] VGAM103 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM103 was detected is described hereinabove with reference to Figs. 1–8.

[9087] VGAM103 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9088] VGAM103 gene encodes a VGAM103 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM103 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM103 precursor RNA is designated SEQ ID:89, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:89 is located at position 49030 relative to the genome of

Plutella Xylostella Granulovirus.

[9089] VGAM103 precursor RNA folds onto itself, forming VGAM103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9090] An enzyme complex designated DICER COMPLEX, `dices` the VGAM103 folded precursor RNA into VGAM103 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 50%) nucleotide sequence of VGAM103 RNA is designated SEQ ID:2814, and is provided hereinbelow with reference to the sequence listing part.

[9091] VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger

RNA, VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM103 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9092] VGAM103 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM103 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM103 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA. It is further

appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9093] The complementary binding of VGAM103 RNA, herein designated VGAM RNA, to host target binding sites on VGAM103 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM103 host target RNA into VGAM103 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9094] It is appreciated that VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM103 host target genes. The mRNA of each one of this plurality of VGAM103 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM103 RNA, herein designated VGAM RNA, and which when bound by VGAM103 RNA causes inhibition of translation of respective one or more VGAM103 host target proteins.

[9095] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM103 gene, herein designated VGAM GENE, on one or more VGAM103 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9096] It is yet further appreciated that a function of VGAM103 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of

VGAM103 correlate with, and may be deduced from, the identity of the host target genes which VGAM103 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9097] Nucleotide sequences of the VGAM103 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM103 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM103 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM103 are further described hereinbelow with reference to Table 1.

[9098] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM103 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM103 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9099] As mentioned hereinabove with reference to Fig. 1, a function of VGAM103 gene, herein designated VGAM is inhibition of expression of VGAM103 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM103 correlate with, and may be deduced

from, the identity of the target genes which VGAM103 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9100] ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916) is a VGAM103 host target gene. ATP8A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP8A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP8A2 BINDING SITE, designated SEQ ID:44918, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9101] A function of VGAM103 is therefore inhibition of ATPase, Aminophospholipid Transporter-like, Class I, Type 8A, Member 2 (ATP8A2, Accession XM_167916). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP8A2. Glucosaminyl (N-acetyl) Transferase 3, Mucin Type (GCNT3, Accession NM_004751) is another VGAM103 host target gene. GCNT3 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region

of mRNA encoded by GCNT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GCNT3 BINDING SITE, designated SEQ ID:11140, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9102] Another function of VGAM103 is therefore inhibition of Glucosaminyl (N-acetyl) Transferase 3, Mucin Type (GCNT3, Accession NM_004751), a gene which catalyzes O-glycan branch synthesis of the core 2 and core 4 type in mucins and controls expression of core 2 branched oligosaccharides and I antigens on the cell surface. Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GCNT3. The function of GCNT3 has been established by previous studies. Mucin-type glycoproteins are unique in that they have clusters of O-glycans containing N-acetylgalactosamine residues at reducing ends, which are linked to serine or threonine. O-glycans are classified according to the core structures, which can be converted in the presence of an N-acetylglucosaminyltransferase, such as GCNT3.

- [9103] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9104] Schwientek, T.; Nomoto, M.; Levery, S. B.; Merkx, G.; van Kessel, A. G.; Bennett, E. P.; Hollingsworth, M. A.; Clausen, H. : Control of O-glycan branch formation: molecular cloning of human cDNA encoding a novel beta-1,6-N-acetylglucosaminyltransferase forming core 2 and core 4. J. Biol. Chem. 274: 4504-4512, 1999. ; and
- [9105] Yeh, J.-C.; Ong, E.; Fukuda, M. : Molecular cloning and expression of a novel beta-1,6-N-acetylglucosaminyltransferase that forms core 2, core 4, and I branches. J. Biol. Chem. 274: 321.
- [9106] Further studies establishing the function and utilities of GCNT3 are found in John Hopkins OMIM database record ID 606836, and in cited publications numbered 557 and 12157 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptogyrin 3 (SYNGR3, Accession NM_004209) is another VGAM103 host target gene. SYNGR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BIND-

ING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SYNGR3 BINDING SITE, designated SEQ ID:10409, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9107] Another function of VGAM103 is therefore inhibition of Synaptogyrin 3 (SYNGR3, Accession NM_004209). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR3. Very Low Density Lipoprotein Receptor (VLDLR, Accession XM_045386) is another VGAM103 host target gene. VLDLR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VLDLR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VLDLR BINDING SITE, designated SEQ ID:34450, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9108] Another function of VGAM103 is therefore inhibition of Very Low Density Lipoprotein Receptor (VLDLR, Accession XM_045386), a gene which may play a crucial role in

triglyceride metabolism. Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VLDLR. The function of VLDLR has been established by previous studies. A specific isoform of apolipoprotein E (OMIM Ref. No. 107741), encoded by the APOE4 allele, is associated with the accelerated rate of disease expression of sporadic Alzheimer disease (AD) and late-onset familial AD. Okuizumi et al. (1995) noted that, in patients who carry the APOE4 allele, an earlier age of onset has also been demonstrated in patients who also have mutations in the amyloid precursor protein gene (OMIM Ref. No. 104760) involving codon 717 (104760.0002) and codons 670 and 671 (104760.0008). On the other hand, the presence of the APOE4 allele makes no difference in familial AD patients with APP692 (104760.0005) or APP693 mutations, nor does it make a difference in chromosome 14-linked familial AD patients (OMIM Ref. No. 104311). Hypothesizing that receptors for APOE-containing lipoproteins act as a potential risk factor for AD, Okuizumi et al. (1995) performed an association study using a polymorphic triplet (CGG) repeat in the VLDLR gene. The frequency of the 5-repeat allele was significantly higher in all Japanese

sporadic AD patients (P less than 0.02) than in Japanese controls. Moreover, the odds ratio was significantly increased in the AD patients homozygous for the 5-repeat allele; OR = 2.1, 95% confidence interval = 1.1–4.2. Multiple logistic regression analysis showed that the relative risk conferred by the presence of 2 copies of the 5-repeat allele and at least 1 copy of the APOE4 allele is 8.7; 95% CI = 2.9–25.8. Okuizumi et al. (1995) concluded that VLDLR is a susceptibility gene for AD. Animal model experiments lend further support to the function of VLDLR. Layering of neurons in the cerebral cortex and cerebellum requires reelin (RELN; 600514), an extracellular matrix protein, and mammalian disabled (DAB1; 603448), a cytosolic protein that activates tyrosine kinases. By targeted disruption experiments in mice, Trommsdorff et al. (1999) showed that 2 cell surface receptors, VLDLR and apolipoprotein E receptor-2 (APOER2; 602600), are also required. Both receptors bound Dab1 on their cytoplasmic tails and were expressed in cortical and cerebellar layers adjacent to layers expressing Reln. Dab1 expression was upregulated in knockout mice lacking both the *Vldlr* and *Apoer2* genes. Inversion of cortical layers, absence of cerebellar foliation, and the migration of Purkinje cells in these animals pre-

cisely mimicked the phenotype of mice lacking Reln or Dab1. These findings established novel signaling functions for the LDL receptor gene family and suggested that VLDLR and APOER2 participate in transmitting the extracellular RELN signal to intracellular signaling processes initiated by DAB1.

[9109] It is appreciated that the abovementioned animal model for VLDLR is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9110] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9111] Okuizumi, K.; Onodera, O.; Namba, Y.; Ikeda, K.; Yamamoto, T.; Seki, K.; Ueki, A.; Nanko, S.; Tanaka, H.; Takahashi, H.; Oyanagi, K.; Mizusawa, H.; Kanazawa, I.; Tsuji, S. : Genetic association of the very low density lipoprotein (VLDL) receptor gene with sporadic Alzheimer's disease. *Nature Genet.* 11: 207–209, 1995. ; and

[9112] Trommsdorff, M.; Gotthardt, M.; Hiesberger, T.; Shelton, J.; Stockinger, W.; Nimpf, J.; Hammer, R. E.; Richardson, J. A.; Herz, J. : Reeler/Disabled-like disruption of neuronal

migration.

[9113] Further studies establishing the function and utilities of VLDLR are found in John Hopkins OMIM database record ID 192977, and in cited publications numbered 10022, 10020–10021, 80 and 10023–10024 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916) is another VGAM103 host target gene. AP1S2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AP1S2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AP1S2 BINDING SITE, designated SEQ ID:10000, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9114] Another function of VGAM103 is therefore inhibition of Adaptor-related Protein Complex 1, Sigma 2 Subunit (AP1S2, Accession NM_003916). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AP1S2. BTB (POZ) Domain Containing 3 (BTBD3, Accession

NM_014962) is another VGAM103 host target gene.

BTBD3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BTBD3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BTBD3 BINDING SITE, designated SEQ ID:17336, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9115] Another function of VGAM103 is therefore inhibition of BTB (POZ) Domain Containing 3 (BTBD3, Accession NM_014962). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BTBD3. FLJ10290 (Accession NM_018047) is another VGAM103 host target gene. FLJ10290 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10290 BINDING SITE, designated SEQ ID:19796, to the nucleotide sequence of VGAM103

RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9116] Another function of VGAM103 is therefore inhibition of FLJ10290 (Accession NM_018047). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10290. FLJ20079 (Accession NM_017656) is another VGAM103 host target gene. FLJ20079 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20079, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20079 BINDING SITE, designated SEQ ID:19178, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9117] Another function of VGAM103 is therefore inhibition of FLJ20079 (Accession NM_017656). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20079. FLJ20695 (Accession NM_017929) is another VGAM103 host target gene. FLJ20695 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ20695, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20695 BINDING SITE, designated SEQ ID:19612, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9118] Another function of VGAM103 is therefore inhibition of FLJ20695 (Accession NM_017929). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20695. HOMER-2B (Accession NM_004839) is another VGAM103 host target gene. HOMER-2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOMER-2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOMER-2B BINDING SITE, designated SEQ ID:11246, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9119] Another function of VGAM103 is therefore inhibition of HOMER-2B (Accession NM_004839). Accordingly, utilities

of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOMER-2B. KIAA1871 (Accession XM_028409) is another VGAM103 host target gene. KIAA1871 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1871, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1871 BINDING SITE, designated SEQ ID:30708, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9120] Another function of VGAM103 is therefore inhibition of KIAA1871 (Accession XM_028409). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1871. Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106) is another VGAM103 host target gene. YAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by YAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of YAP1 BINDING SITE, designated SEQ ID:12754, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9121] Another function of VGAM103 is therefore inhibition of Yes-associated Protein 1, 65kDa (YAP1, Accession NM_006106). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with YAP1. LOC221477 (Accession XM_166397) is another VGAM103 host target gene. LOC221477 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221477 BINDING SITE, designated SEQ ID:44251, to the nucleotide sequence of VGAM103 RNA, herein designated VGAM RNA, also designated SEQ ID:2814.

[9122] Another function of VGAM103 is therefore inhibition of LOC221477 (Accession XM_166397). Accordingly, utilities of VGAM103 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221477. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 104 (VGAM104) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9123] VGAM104 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM104 was detected is described hereinabove with reference to Figs. 1–8.

[9124] VGAM104 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9125] VGAM104 gene encodes a VGAM104 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM104 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM104 precursor RNA is designated SEQ ID:90, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:90 is

located at position 67576 relative to the genome of
Plutella Xylostella Granulovirus.

[9126] VGAM104 precursor RNA folds onto itself, forming VGAM104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9127] An enzyme complex designated DICER COMPLEX, `dices` the VGAM104 folded precursor RNA into VGAM104 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM104 RNA is designated SEQ ID:2815, and is provided hereinbelow with reference to the sequence listing part.

[9128] VGAM104 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM104 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9129] VGAM104 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM104 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM104 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM104 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9130] The complementary binding of VGAM104 RNA, herein designated VGAM RNA, to host target binding sites on VGAM104 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM104 host target RNA into VGAM104 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9131] It is appreciated that VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM104 host target genes. The mRNA of each one of this plurality of VGAM104 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM104 RNA, herein designated VGAM RNA, and which when bound by VGAM104 RNA causes inhibition of translation of respective one or more VGAM104

host target proteins.

[9132] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM104 gene, herein designated VGAM GENE, on one or more VGAM104 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9133] It is yet further appreciated that a function of VGAM104 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of viral infection by *Plutella Xylostella* Gran-

ulovirus. Specific functions, and accordingly utilities, of VGAM104 correlate with, and may be deduced from, the identity of the host target genes which VGAM104 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9134] Nucleotide sequences of the VGAM104 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM104 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM104 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM104 are further described hereinbelow with reference to Table 1.
- [9135] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM104 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM104 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9136] As mentioned hereinabove with reference to Fig. 1, a function of VGAM104 gene, herein designated VGAM is inhibition of expression of VGAM104 target genes. It is appreciated that specific functions, and accordingly utili-

ties, of VGAM104 correlate with, and may be deduced from, the identity of the target genes which VGAM104 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9137] Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418) is a VGAM104 host target gene. C11orf25 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by C11orf25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C11orf25 BINDING SITE, designated SEQ ID:25397, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:2815.

[9138] A function of VGAM104 is therefore inhibition of Chromosome 11 Open Reading Frame 25 (C11orf25, Accession NM_031418). Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C11orf25. LOC150142 (Accession XM_086791) is another VGAM104 host target gene. LOC150142 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded

by LOC150142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150142 BINDING SITE, designated SEQ ID:38847, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:2815.

[9139] Another function of VGAM104 is therefore inhibition of LOC150142 (Accession XM_086791). Accordingly, utilities of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150142. LOC200982 (Accession XM_117305) is another VGAM104 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43371, to the nucleotide sequence of VGAM104 RNA, herein designated VGAM RNA, also designated SEQ ID:2815.

[9140] Another function of VGAM104 is therefore inhibition of LOC200982 (Accession XM_117305). Accordingly, utilities

of VGAM104 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 105 (VGAM105) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9141] VGAM105 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM105 was detected is described hereinabove with reference to Figs. 1–8.

[9142] VGAM105 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Plutella Xylostella Granulovirus. VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9143] VGAM105 gene encodes a VGAM105 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM105 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM105 precursor RNA is designated SEQ ID:91, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:91 is located at position 89565 relative to the genome of *Plutella Xylostella Granulovirus*.

[9144] VGAM105 precursor RNA folds onto itself, forming VGAM105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9145] An enzyme complex designated DICER COMPLEX, `dices` the VGAM105 folded precursor RNA into VGAM105 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM105 RNA is designated SEQ ID:2816, and

is provided hereinbelow with reference to the sequence listing part.

[9146] VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM105 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9147] VGAM105 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM105 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM105 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9148] The complementary binding of VGAM105 RNA, herein designated VGAM RNA, to host target binding sites on VGAM105 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM105 host target RNA into VGAM105 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9149] It is appreciated that VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM105 host target genes. The mRNA of each one of this plurality of VGAM105 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM105 RNA, herein designated VGAM RNA, and which when bound by VGAM105 RNA causes inhibition of translation of respective one or more VGAM105 host target proteins.

[9150] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM105 gene, herein designated VGAM GENE, on one or more VGAM105 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9151] It is yet further appreciated that a function of VGAM105 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of viral infection by Plutella Xylostella Granulovirus. Specific functions, and accordingly utilities, of VGAM105 correlate with, and may be deduced from, the identity of the host target genes which VGAM105 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9152] Nucleotide sequences of the VGAM105 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM105 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM105 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM105 are further described hereinbelow with reference to Table 1.

[9153] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM105 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM105 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9154] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM105 gene, herein designated VGAM is inhibition of expression of VGAM105 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM105 correlate with, and may be deduced from, the identity of the target genes which VGAM105 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9155] FLJ10292 (Accession NM_018048) is a VGAM105 host target gene. FLJ10292 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10292, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10292 BINDING SITE, designated SEQ ID:19801, to the nucleotide sequence of VGAM105 RNA, herein designated VGAM RNA, also designated SEQ ID:2816.

[9156] A function of VGAM105 is therefore inhibition of FLJ10292 (Accession NM_018048). Accordingly, utilities of VGAM105 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10292. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present inven-

tion, referred to here as Viral Genomic Address Messenger 106 (VGAM106) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9157] VGAM106 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM106 was detected is described hereinabove with reference to Figs. 1–8.

[9158] VGAM106 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9159] VGAM106 gene encodes a VGAM106 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM106 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM106 precursor RNA is designated SEQ ID:92, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:92 is located at position 49997 relative to the genome of Saimiriine Herpesvirus 2.

[9160] VGAM106 precursor RNA folds onto itself, forming VGAM106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9161] An enzyme complex designated DICER COMPLEX, `dices` the VGAM106 folded precursor RNA into VGAM106 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 53%) nucleotide sequence of VGAM106 RNA is designated SEQ ID:2817, and is provided hereinbelow with reference to the sequence listing part.

[9162] VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM106 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM106 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9163] VGAM106 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM106 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM106 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9164] The complementary binding of VGAM106 RNA, herein designated VGAM RNA, to host target binding sites on VGAM106 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM106 host target RNA into VGAM106 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9165] It is appreciated that VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM106 host target genes. The mRNA of each one of this plurality of VGAM106 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM106 RNA, herein designated VGAM RNA, and which when bound by VGAM106 RNA causes inhibition of translation of respective one or more VGAM106 host target proteins.

[9166] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM106 gene, herein designated VGAM GENE, on one or more VGAM106 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9167] It is yet further appreciated that a function of VGAM106 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM106 correlate with, and may be deduced from, the identity of

the host target genes which VGAM106 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9168] Nucleotide sequences of the VGAM106 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM106 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM106 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM106 are further described hereinbelow with reference to Table 1.

[9169] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM106 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM106 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9170] As mentioned hereinabove with reference to Fig. 1, a function of VGAM106 gene, herein designated VGAM is inhibition of expression of VGAM106 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM106 correlate with, and may be deduced from, the identity of the target genes which VGAM106

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9171] Inositol 1,4,5-triphosphate Receptor, Type 1 (ITPR1, Accession NM_002222) is a VGAM106 host target gene. ITPR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ITPR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ITPR1 BINDING SITE, designated SEQ ID:7986, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9172] A function of VGAM106 is therefore inhibition of Inositol 1,4,5-triphosphate Receptor, Type 1 (ITPR1, Accession NM_002222), a gene which couples cell membrane receptors to Ca^{2+} signal transduction pathways. Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ITPR1. The function of ITPR1 has been established by previous studies. Inositol 1,4,5-triphosphate is an intracellular second messenger produced by phospholipase C through a G protein-dependent mechanism. It releases calcium from endoplasmic reticulum by binding to specific

receptors that are coupled to calcium channels. These receptors are abundant in neuronal and nonneuronal tissues. The neuronal form of the receptor is abundant in the cerebellum, particularly the perikaryon of the Purkinje cells. Matsumoto et al. (1996) noted that the product of the ITPR1 gene is predominantly enriched in cerebellar Purkinje cells but is also concentrated in neurons in the hippocampal CA1 region, caudate-putamen, and cerebral cortex. The inositol triphosphate receptor shares sequence and functional homology with the ryanodine receptor (OMIM Ref. No. 180901); they both trigger the release of calcium from intracellular stores. The primary structure of the inositol triphosphate receptor contains 3 domains: an inositol triphosphate binding domain near the N terminus, a coupling domain in the middle of the molecule, and a transmembrane spanning domain near the C terminus. In addition, there are at least 2 consensus protein kinase A phosphorylation sites and at least 1 consensus ATP-binding site (Nucifora et al., 1995). Matsumoto et al. (1996) found that most ITPR1-deficient mice generated by gene targeting die in utero, and that most animals that are born alive have severe ataxia and tonic or tonic-clonic seizures and die by the weaning period. Elec-

troencephalograms showed that they suffer from epilepsy, indicating that ITPR1 is essential for proper brain function. However, observation by light microscope of the hematoxylin–eosin staining of the brain and peripheral tissues of deficient mice showed no abnormality and the unique electrophysiologic properties of the cerebellar Purkinje cells of deficient mice were not severely impaired. In the mouse the *Intp3r* locus is closely situated to the 'opisthotonus' mutant locus (*opt*), and *Opt* homozygous mutant mice exhibit phenotypes similar to those described for the knockout mice. The *opt* locus is on mouse chromosome 6

[9173] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

1,4,5-trisphosphate receptor type 1, and the identification of.

[9176] Further studies establishing the function and utilities of ITPR1 are found in John Hopkins OMIM database record ID 147265, and in cited publications numbered 4976–4977, 481 and 4820 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Matrix Metalloproteinase 19 (MMP19, Accession NM_002429) is another VGAM106 host target gene. MMP19 BINDING SITE1 and MMP19 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MMP19, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MMP19 BINDING SITE1 and MMP19 BINDING SITE2, designated SEQ ID:8267 and SEQ ID:23074 respectively, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9177] Another function of VGAM106 is therefore inhibition of Matrix Metalloproteinase 19 (MMP19, Accession NM_002429). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clini-

cal conditions associated with MMP19. Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012) is another VGAM106 host target gene. C9orf5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by C9orf5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C9orf5 BINDING SITE, designated SEQ ID:25717, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9178] Another function of VGAM106 is therefore inhibition of Chromosome 9 Open Reading Frame 5 (C9orf5, Accession NM_032012). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C9orf5. Di-Ras2 (Accession NM_017594) is another VGAM106 host target gene. Di-Ras2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by Di-Ras2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of Di-Ras2 BINDING SITE, designated SEQ

ID:19042, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9179] Another function of VGAM106 is therefore inhibition of Di-Ras2 (Accession NM_017594). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with Di-Ras2. DKFZP434P211 (Accession NM_014549) is another VGAM106 host target gene. DKFZP434P211 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP434P211, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP434P211 BINDING SITE, designated SEQ ID:15865, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9180] Another function of VGAM106 is therefore inhibition of DKFZP434P211 (Accession NM_014549). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP434P211. FLJ23017 (Accession NM_022840) is another VGAM106 host target gene. FLJ23017 BINDING

SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23017, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23017 BINDING SITE, designated SEQ ID:23128, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9181] Another function of VGAM106 is therefore inhibition of FLJ23017 (Accession NM_022840). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23017. KIAA0523 (Accession XM_041964) is another VGAM106 host target gene. KIAA0523 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0523 BINDING SITE, designated SEQ ID:33644, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9182] Another function of VGAM106 is therefore inhibition of

KIAA0523 (Accession XM_041964). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0523. KIAA1046 (Accession NM_014928) is another VGAM106 host target gene. KIAA1046 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1046, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1046 BINDING SITE, designated SEQ ID:17221, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9183] Another function of VGAM106 is therefore inhibition of KIAA1046 (Accession NM_014928). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1046. Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714) is another VGAM106 host target gene. PPP1R10 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPP1R10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPP1R10 BINDING SITE, designated SEQ ID:8578, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9184] Another function of VGAM106 is therefore inhibition of Protein Phosphatase 1, Regulatory Subunit 10 (PPP1R10, Accession NM_002714). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPP1R10. SEC15B (Accession XM_039570) is another VGAM106 host target gene. SEC15B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SEC15B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SEC15B BINDING SITE, designated SEQ ID:33126, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9185] Another function of VGAM106 is therefore inhibition of SEC15B (Accession XM_039570). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with SEC15B. Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM_012460) is another VGAM106 host target gene. TIMM9 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by TIMM9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIMM9 BINDING SITE, designated SEQ ID:14831, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9186] Another function of VGAM106 is therefore inhibition of Translocase of Inner Mitochondrial Membrane 9 Homolog (yeast) (TIMM9, Accession NM_012460). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIMM9. LOC150174 (Accession XM_086802) is another VGAM106 host target gene. LOC150174 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC150174, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of
LOC150174 BINDING SITE, designated SEQ ID:38872, to
the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9187] Another function of VGAM106 is therefore inhibition of LOC150174 (Accession XM_086802). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150174. LOC150213 (Accession XM_059324) is another VGAM106 host target gene. LOC150213 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150213, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150213 BINDING SITE, designated SEQ ID:36956, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9188] Another function of VGAM106 is therefore inhibition of LOC150213 (Accession XM_059324). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150213. LOC152313 (Accession XM_098190) is another VGAM106 host target gene. LOC152313 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152313, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152313 BINDING SITE, designated SEQ ID:41472, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9189] Another function of VGAM106 is therefore inhibition of LOC152313 (Accession XM_098190). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152313. LOC201965 (Accession XM_114412) is another VGAM106 host target gene. LOC201965 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC201965, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC201965 BINDING SITE, designated SEQ ID:42934, to the nucleotide sequence of VGAM106 RNA, herein designated VGAM RNA, also designated SEQ ID:2817.

[9190] Another function of VGAM106 is therefore inhibition of LOC201965 (Accession XM_114412). Accordingly, utilities of VGAM106 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC201965. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 107 (VGAM107) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9191] VGAM107 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM107 was detected is described hereinabove with reference to Figs. 1–8.

[9192] VGAM107 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9193] VGAM107 gene encodes a VGAM107 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM107 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM107 precursor RNA is designated SEQ ID:93, and is provided hereinbelow with reference to the

sequence listing part. Nucleotide sequence SEQ ID:93 is located at position 50521 relative to the genome of Saimiriine Herpesvirus 2.

[9194] VGAM107 precursor RNA folds onto itself, forming VGAM107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9195] An enzyme complex designated DICER COMPLEX, `dices` the VGAM107 folded precursor RNA into VGAM107 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM107 RNA is designated SEQ ID:2818, and is provided hereinbelow with reference to the sequence listing part.

[9196] VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM107 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9197] VGAM107 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM107 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM107 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9198] The complementary binding of VGAM107 RNA, herein designated VGAM RNA, to host target binding sites on VGAM107 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM107 host target RNA into VGAM107 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9199] It is appreciated that VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM107 host target genes. The mRNA of each one of this plurality of VGAM107 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM107 RNA, herein designated VGAM RNA, and which when bound by VGAM107 RNA causes in-

hibition of translation of respective one or more VGAM107 host target proteins.

[9200] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM107 gene, herein designated VGAM GENE, on one or more VGAM107 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9201] It is yet further appreciated that a function of VGAM107 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM107 include diagnosis, prevention and

treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM107 correlate with, and may be deduced from, the identity of the host target genes which VGAM107 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9202] Nucleotide sequences of the VGAM107 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM107 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM107 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM107 are further described hereinbelow with reference to Table 1.

[9203] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM107 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM107 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9204] As mentioned hereinabove with reference to Fig. 1, a function of VGAM107 gene, herein designated VGAM is inhibition of expression of VGAM107 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM107 correlate with, and may be deduced from, the identity of the target genes which VGAM107 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9205] Epithelial Membrane Protein 1 (EMP1, Accession NM_001423) is a VGAM107 host target gene. EMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EMP1 BINDING SITE, designated SEQ ID:7134, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9206] A function of VGAM107 is therefore inhibition of Epithelial Membrane Protein 1 (EMP1, Accession NM_001423), a gene which plays a role in squamous cell differentiation; member of the PMP22/EMP/MP20 family of membrane glycoproteins. Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EMP1. The function of EMP1 has been established by previous studies. Ben-Porath and

Benvenisty (1996) cloned a cDNA encoding epithelial membrane protein-1 (EMP1), named TMP by them, using RT-PCR on human embryo kidney RNA. Ruegg et al. (1996) independently isolated a cDNA encoding EMP1, termed B4B by them, using differential display PCR. The predicted 157-amino acid EMP1 protein contains 4 trans-membrane domains and 2 potential N-linked glycosylation sites in the first extracellular loop. Chen et al. (1997) found that EMP1, named CL-20 by them, shares 39% amino acid identity with peripheral myelin protein-22 (PMP22; 601097); the conserved amino acids are located predominantly within the membrane-spanning domains. Due to the high amino acid sequence homology among PMP22, EMP1, EMP2 (OMIM Ref. No. 602334), and EMP3 (OMIM Ref. No. 602335), Ben-Porath and Benvenisty (1996) proposed that these proteins are members of a novel family. Based on the suggested functions of PMP22, they proposed that EMP1 is involved in cell-cell interactions and the control of cell proliferation. Chen et al. (1997) found that the EMP1 gene contains 5 exons and 4 introns, and they noted that the exon/intron junctions are located at the same positions as those of PMP22, suggesting that EMP1 and PMP22 arose by duplication of a com-

mon ancestral gene. Using Northern blot analysis, they detected a 2.8-kb EMP1 transcript in most of the adult tissues examined, but not in brain, liver, pancreas, or peripheral blood leukocytes. Using RT-PCR, Ben-Porath and Benvenisty (1996) detected EMP1 expression in embryonic kidney, brain, and gut, but not in liver and thymus. Marvin et al. (1995) localized the EMP1 gene to chromosome 12 using a somatic cell hybrid panel. By fluorescence in situ hybridization, Chen et al. (1997) and Ruegg et al. (1996) mapped the EMP1 gene to 12p12 and 20q12-q13.1, respectively. By FISH, somatic cell hybridization, and radiation hybrid analysis, Liehr et al. (1999) confirmed assignment of the EMP1 gene to chromosome 12p12.3. Ben Porath et al. (1998) mapped the homologous gene in the mouse to chromosome 6.

[9207] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9208] Ben Porath, I.; Kozak, C. A.; Benvenisty, N. : Chromosomal mapping of Tmp (Emp1), Xmp (Emp2), and Ymp (Emp3), genes encoding membrane proteins related to Pmp22. Genomics 49: 443-447, 1998. ; and

[9209] Chen, Y.; Medvedev, A.; Ruzanov, P.; Marvin, K. W.; Jetten,

A. M. : cDNA cloning, genomic structure, and chromosome mapping of the human epithelial membrane protein CL-20 gene (EMP1), a.

[9210] Further studies establishing the function and utilities of EMP1 are found in John Hopkins OMIM database record ID 602333, and in cited publications numbered 9305-6011 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315) is another VGAM107 host target gene. MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MAPK14, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAPK14 BINDING SITE1 through MAPK14 BINDING SITE3, designated SEQ ID:7000, SEQ ID:29111 and SEQ ID:29104 respectively, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9211] Another function of VGAM107 is therefore inhibition of Mitogen-activated Protein Kinase 14 (MAPK14, Accession NM_001315), a gene which is important for cytokine pro-

duction; responds to changes in extracellular osmolarity. Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAPK14. The function of MAPK14 has been established by previous studies. Tamura et al. (2000) investigated a role for Mapk14 in mouse development and physiology by targeted disruption of the Mapk14 gene. Whereas some Mapk14 $-/-$ embryos died between embryonic days 11.5 and 12.5, those that developed past this stage had normal morphology but were anemic, owing to failed definitive erythropoiesis caused by diminished expression of the erythropoietin gene (EPO; 133170). Since Mapk14-deficient hematopoietic stem cells reconstituted lethally irradiated hosts, Mapk14 function is not required downstream of the Epo receptor (EPOR; 133171). Inhibition of MAPK14 activity also interfered with stabilization of EPO mRNA in human hepatoma cells undergoing hypoxic stress. The authors concluded that MAPK14 plays a critical role linking developmental and stress-induced erythropoiesis through regulation of EPO expression. Using a yeast 2-hybrid screen of gastrointestinal tract tissue with p38-alpha as the bait, Ge et al. (2002) isolated multiple clones encoding TAB1 (OMIM Ref. No. 602615). Im-

munoprecipitation and GST pull-down analyses indicated that TAB1 interacts with p38- α , but not with other MAPKs, with or without treatment with TNF. Immunoblot analysis showed that coexpression of TAB1 and p38- α enhanced autophosphorylation of p38- α even in the presence of dominant-negative forms of MAP2Ks (e.g., MAP2K3; 602315) and TAK1 (MAP3K7; 602614). The amino acids between positions 373 and 418 of TAB1 were found to be required for phosphorylation of p38- α . Expression of TLR2 (OMIM Ref. No. 603028) caused p38- α phosphorylation in the presence or absence of inhibitors, whereas p38- α phosphorylation after stimulation of TLR4 (OMIM Ref. No. 603030) could be inhibited by mutant TAB1, suggesting that activation of p38- α can be TAB1 dependent or independent. Immunoblot analysis detected the formation of TRAF6 (OMIM Ref. No. 602355)-TAB1-p38- α complexes. Formation of these complexes could be enhanced by stimulation with lipopolysaccharide. Ge et al. (2002) concluded that activation of p38- α by a nonenzymatic adaptor protein such as TAB1 may be an important alternative activation pathway operating in parallel with kinase cascades in regulating intracellular signaling

- [9212] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9213] Tamura, K.; Sudo, T.; Senftleben, U.; Dadak, A. M.; Johnson, R.; Karin, M. : Requirement for p38-alpha in erythropoietin expression: a role for stress kinases in erythropoiesis. Cell 102: 221-231, 2000. ; and
- [9214] Ge, B.; Gram, H.; Di Padova, F.; Huang, B.; New, L.; Ulevitch, R. J.; Luo, Y.; Han, J. : MAPKK-independent activation of p38-alpha mediated by TAB1-dependent autophosphorylation of p38- α .
- [9215] Further studies establishing the function and utilities of MAPK14 are found in John Hopkins OMIM database record ID 600289, and in cited publications numbered 10123, 10124, 10125-1013 and 11101 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Synaptogyrin 1 (SYNGR1, Accession NM_004711) is another VGAM107 host target gene. SYNGR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SYNGR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of SYNGR1 BINDING SITE, designated SEQ ID:11058, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9216] Another function of VGAM107 is therefore inhibition of Synaptogyrin 1 (SYNGR1, Accession NM_004711), a gene which belongs to transmembrane synaptic vesicle protein and may function in membrane recycling. Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SYNGR1. The function of SYNGR1 has been established by previous studies. Rat synaptogyrin, or RAT-SYNGR1, is an integral membrane protein associated with presynaptic vesicles in neuronal cells. See SYNGR2 (OMIM Ref. No. 603926). As part of an effort to sequence the long arm of human chromosome 22, Kedra et al. (1998) identified the human homolog of RATSNGR1, synaptogyrin-1 (OMIM Ref. No. SYNGR1). By a combination of EST database searching and library screening, the authors isolated cDNAs corresponding to 3 alternatively spliced transcripts, which they designated SYNGR1a-c. The predicted 1a, 1b, and 1c proteins contain 234, 191, and 192 amino acids, respectively. Northern blot analysis revealed that

the 4.5-kb SYNGR1a mRNA is expressed at high levels in brain. The other transcript forms are expressed at low levels in nonneuronal tissues. In situ hybridization to embryonic and adult mouse tissues confirmed that SYNGR1a, the most abundant transcript form, shows predominantly neuronal expression. Kedra et al. (1998) also identified cDNAs encoding the related human proteins SYNGR2 and SYNGR3 (OMIM Ref. No. 603927) and mouse *Syng1b*. Like RATSNGR1, the mouse and human synaptogyrin family members contain 4 membrane-spanning domains. The conserved central portion of SYNGR1a shares 54%, 61%, and 92% identity with that of SYNGR2, SYNGR3, and RATSNGR1, respectively. Animal model experiments lend further support to the function of SYNGR1. Using gene targeting, Janz et al. (1999) generated mice lacking *Syng1*. They bred these *Syng1* knockout mice against *Syp* (OMIM Ref. No. 313475) knockout mice generated by McMahon et al. (1996) to create double knockout mice deficient in both *Syp* and *Syng1*. Both single and double knockout mice were viable and fertile. Morphologic and biochemical analysis showed that the architecture and composition of synapses were unaltered in the brains of *Syng1* single knockout and *Syng1/Syp* double knockout

mutant mice. Electrophysiologic recordings in the hippocampal CA1 region revealed that short- and long-term synaptic plasticity was severely reduced in the Syngn1/Syp double knockout mice without changes in the fundamental release apparatus, vesicle cycling, or release probability. Janz et al. (1999) concluded that Syngn1 and Syp perform essential and redundant functions in synaptic plasticity without being required for synaptic transmission as such.

[9217] It is appreciated that the abovementioned animal model for SYNGR1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9218] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9219] Janz, R.; Sudhof, T. C.; Hammer, R. E.; Unni, V.; Siegelbaum, S. A.; Bolshakov, V. Y. : Essential roles in synaptic plasticity for synaptogyrin I and synaptophysin I. *Neuron* 24: 687–700, 1999. ; and

[9220] Kedra, D.; Pan, H.-Q.; Seroussi, E.; Fransson, I.; Guilbaud, C.; Collins, J. E.; Dunham, I.; Blennow, E.; Roe, B. A.; Piehl, F.; Dumanski, J. P. : Characterization of the human

synapto.

[9221] Further studies establishing the function and utilities of SYNGR1 are found in John Hopkins OMIM database record ID 603925, and in cited publications numbered 815 and 8157 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723) is another VGAM107 host target gene. ARHGEF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ARHGEF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ARHGEF2 BINDING SITE, designated SEQ ID:11092, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9222] Another function of VGAM107 is therefore inhibition of Rho/rac Guanine Nucleotide Exchange Factor (GEF) 2 (ARHGEF2, Accession NM_004723). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ARHGEF2. Bladder Cancer Associated Protein (BLCAP, Ac-

cession NM_006698) is another VGAM107 host target gene. BLCAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by BLCAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BLCAP BINDING SITE, designated SEQ ID:13520, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9223] Another function of VGAM107 is therefore inhibition of Bladder Cancer Associated Protein (BLCAP, Accession NM_006698). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BLCAP. FLJ14800 (Accession NM_032840) is another VGAM107 host target gene. FLJ14800 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14800, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14800 BINDING SITE, designated SEQ ID:26622, to the nucleotide sequence of VGAM107 RNA,

herein designated VGAM RNA, also designated SEQ ID:2818.

[9224] Another function of VGAM107 is therefore inhibition of FLJ14800 (Accession NM_032840). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14800. HSPC019 (Accession NM_014028) is another VGAM107 host target gene. HSPC019 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC019, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC019 BINDING SITE, designated SEQ ID:15251, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9225] Another function of VGAM107 is therefore inhibition of HSPC019 (Accession NM_014028). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC019. KIAA1729 (Accession XM_114418) is another VGAM107 host target gene. KIAA1729 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA

encoded by KIAA1729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1729 BINDING SITE, designated SEQ ID:42947, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9226] Another function of VGAM107 is therefore inhibition of KIAA1729 (Accession XM_114418). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1729. Olfactomedin 3 (OLFM3, Accession XM_088951) is another VGAM107 host target gene. OLFM3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OLFM3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OLFM3 BINDING SITE, designated SEQ ID:39959, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9227] Another function of VGAM107 is therefore inhibition of

Olfactomedin 3 (OLFM3, Accession XM_088951). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OLFM3. PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM_015148) is another VGAM107 host target gene. PASK BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PASK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PASK BINDING SITE, designated SEQ ID:17501, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9228] Another function of VGAM107 is therefore inhibition of PAS Domain Containing Serine/threonine Kinase (PASK, Accession NM_015148). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PASK. LOC253613 (Accession XM_171225) is another VGAM107 host target gene. LOC253613 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC253613, corresponding to a HOST TARGET binding

site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC253613 BINDING SITE, designated SEQ ID:46007, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9229] Another function of VGAM107 is therefore inhibition of LOC253613 (Accession XM_171225). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC253613. LOC90092 (Accession XM_028862) is another VGAM107 host target gene. LOC90092 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90092, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90092 BINDING SITE, designated SEQ ID:30789, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9230] Another function of VGAM107 is therefore inhibition of LOC90092 (Accession XM_028862). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC90092. LOC91748 (Accession XM_040343) is another VGAM107 host target gene. LOC91748 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC91748 BINDING SITE, designated SEQ ID:33287, to the nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9231] Another function of VGAM107 is therefore inhibition of LOC91748 (Accession XM_040343). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91748. LOC92249 (Accession XM_043814) is another VGAM107 host target gene. LOC92249 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC92249, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92249 BINDING SITE, designated SEQ ID:34019, to the

nucleotide sequence of VGAM107 RNA, herein designated VGAM RNA, also designated SEQ ID:2818.

[9232] Another function of VGAM107 is therefore inhibition of LOC92249 (Accession XM_043814). Accordingly, utilities of VGAM107 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92249. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 108 (VGAM108) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9233] VGAM108 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM108 was detected is described hereinabove with reference to Figs. 1–8.

[9234] VGAM108 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9235] VGAM108 gene encodes a VGAM108 precursor RNA,

herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM108 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM108 precursor RNA is designated SEQ ID:94, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:94 is located at position 50791 relative to the genome of Saimiriine Herpesvirus 2.

[9236] VGAM108 precursor RNA folds onto itself, forming VGAM108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9237] An enzyme complex designated DICER COMPLEX, `dices` the VGAM108 folded precursor RNA into VGAM108 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 66%) nucleotide sequence of VGAM108 RNA is designated SEQ ID:2819, and is provided hereinbelow with reference to the sequence listing part.

[9238] VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM108 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9239] VGAM108 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM108 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM108 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9240] The complementary binding of VGAM108 RNA, herein designated VGAM RNA, to host target binding sites on VGAM108 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM108 host target RNA into VGAM108 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9241] It is appreciated that VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM108 host target genes. The mRNA of each one of this plurality of VGAM108 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM108 RNA, herein designated VGAM RNA, and which when bound by VGAM108 RNA causes inhibition of translation of respective one or more VGAM108 host target proteins.

[9242] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM108 gene, herein designated VGAM GENE, on one or more VGAM108 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[9243] It is yet further appreciated that a function of VGAM108 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM108 correlate with, and may be deduced from, the identity of the host target genes which VGAM108 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9244] Nucleotide sequences of the VGAM108 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM108 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM108 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM108 are further described hereinbelow with reference to Table 1.

[9245] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM108 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM108 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9246] As mentioned hereinabove with reference to Fig. 1, a function of VGAM108 gene, herein designated VGAM is inhibition of expression of VGAM108 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM108 correlate with, and may be deduced from, the identity of the target genes which VGAM108 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9247] Adenylate Cyclase 7 (ADCY7, Accession NM_001114) is a VGAM108 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6782, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9248] A function of VGAM108 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM_001114), a gene

which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 has been established by previous studies. Hellevuo et al. (1993) identified a novel form of human adenylyl cyclase (ADCY7) in the human erythroleukemia cell line HEL. It appeared that ADCY7 is the major form of adenylyl cyclase in human platelets. Hellevuo et al. (1995) used PCR techniques in the study of human/rodent somatic hybrid panels and a YAC library to demonstrate that the ADCY7 gene is located on 16q12-q13. The adenylyl cyclase enzyme family is characterized by the presence of 12 membrane-spanning domains in its sequences, and this region of the genome is known to contain other genes encoding proteins characterized by 12 membrane-spanning domains: norepinephrine transporter protein-1 (NET1; 163970), located at 16q12.2, and renal sodium-glucose transporter-2 (SGLT2; 182381), located at 16p11.2.

[9249] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9250] Hellevuo, K.; Berry, R.; Sikela, J. M.; Tabakoff, B. : Local-

ization of the gene for a novel human adenylyl cyclase (ADCY7) to chromosome 16. Hum. Genet. 95: 197–200, 1995. ; and

[9251] Hellevuo, K.; Yoshimura, M.; Kao, M.; Hoffman, P. L.; Cooper, D. M. F.; Tabakoff, B. : A novel adenylyl cyclase sequence cloned from the human erythroleukemia cell line. Biochem. Biophys.

[9252] Further studies establishing the function and utilities of ADCY7 are found in John Hopkins OMIM database record ID 600385, and in cited publications numbered 10690–10691 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB4A, Member RAS Oncogene Family (RAB4A, Accession NM_004578) is another VGAM108 host target gene. RAB4A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB4A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB4A BINDING SITE, designated SEQ ID:10925, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9253] Another function of VGAM108 is therefore inhibition of RAB4A, Member RAS Oncogene Family (RAB4A, Accession NM_004578), a gene which is involved in protein transport. Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB4A. The function of RAB4A and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM71. Transcriptional Intermediary Factor 1 (TIF1, Accession XM_016701) is another VGAM108 host target gene. TIF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TIF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TIF1 BINDING SITE, designated SEQ ID:30276, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9254] Another function of VGAM108 is therefore inhibition of Transcriptional Intermediary Factor 1 (TIF1, Accession XM_016701), a gene which mediates the activation function (AF-2) of nuclear estrogen receptor. Accordingly,

utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TIF1. The function of TIF1 has been established by previous studies. Hormonal regulation of gene activity is mediated by nuclear receptors acting as ligand-activated transcription factors. The activity of the ligand-dependent activation function, or AF2, of the receptors requires intermediary factors that interact with the AF2-activating domain, a C-terminal region that is highly conserved in the nuclear receptor family. Thenot et al. (1997) isolated human breast cancer cell cDNAs that encode transcription intermediary factor-1 (TIF1), a protein that is able to bind to the AF2-activating domain of the estrogen receptor (ESR; e.g., 133430). The deduced 1,013-amino acid TIF1 protein, which is more than 92% conserved with mouse Tif1, contains several domains: a RING finger, B-box fingers, a coiled-coil domain, a PHD homeodomain finger, and a bromodomain. A 26-amino acid region of TIF1 is sufficient for its hormone-dependent binding to the ESR. Thenot et al. (1997) demonstrated that the AF2-activating domain of ESR is required but not sufficient for the binding of TIF1, that TIF1 association with DNA-bound ESR requires the presence of estradiol, and that TIF1 interacts

selectively with different nuclear receptors. The authors identified a cDNA variant that encodes a TIF1 isoform containing a 34-amino acid insertion. Northern blot analysis detected a major 4.5-kb transcript in MCF7 breast cancer cells. Fusion of PML (OMIM Ref. No. 102578) and TIF1A to RARA (OMIM Ref. No. 180240) and BRAF (OMIM Ref. No. 164757), respectively, results in the production of PML-RAR-alpha and TIF1-alpha-B-RAF (T18) oncoproteins. Zhong et al. (1999) showed that PML, TIF1-alpha, and RXR-alpha (OMIM Ref. No. 180245)/RAR-alpha function together in a retinoic acid-dependent transcription complex. Zhong et al. (1999) found that PML acts as a ligand-dependent coactivator of RXR-alpha/RARA-alpha. PML interacts with TIF1-alpha and CREB-binding protein (CBP; 600140). In PML -/- cells, the retinoic acid-dependent induction of genes such as RARB2 and the ability of TIF1-alpha and CBP to act as transcriptional coactivators on retinoic acid are impaired. Zhong et al. (1999) showed that both PML and TIF1-alpha are growth suppressors required for the growth-inhibitory activity of retinoic acid. T18, similar to PML-RAR-alpha, disrupts the retinoic acid-dependent activity of this complex in a dominant-negative manner, resulting in a growth advantage.

PML-RAR-alpha was the first example of an oncoprotein generated by the fusion of 2 molecules participating in the same pathway, specifically the fusion of a transcription factor to one of its own cofactors. Since the PML and RAR-alpha pathways converge at the transcriptional level, there is no need for a double-dominant-negative product to explain the pathogenesis of acute promyelocytic leukemia, or APL. Beckstead et al. (2001) found that the *Drosophila* 'bonus' (bon) gene encodes a homolog of the vertebrate TIF1 transcriptional cofactors. Bon is required for male viability, molting, and numerous events in metamorphosis, including leg elongation, bristle development, and pigmentation. Most of these processes are associated with genes that are implicated in the ecdysone pathway, a nuclear hormone receptor pathway required throughout *Drosophila* development. Bon is associated with sites on the polytene chromosomes and can interact with numerous *Drosophila* nuclear receptor proteins. In vivo, bon behaves as a transcriptional inhibitor.

[9255] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9256] Zhong, S.; Delva, L.; Rachez, C.; Cenciarelli, C.; Gandini,

D.; Zhang, H.; Kalantry, S.; Freedman, L. P.; Pandolfi, P. P. : A RA-dependent, tumour-growth suppressive transcription complex is the target of the PML-RAR-alpha and T18 oncoproteins. *Nature Genet.* 23: 287-295, 1999. ; and

[9257] Beckstead, R.; Ortiz, J. A.; Sanchez, C.; Prokopenko, S. N.; Chambon, P.; Losson, R.; Bellen, H. J. : Bonus, a *Drosophila* homolog of TIF1 proteins, interacts with nuclear receptors and.

[9258] Further studies establishing the function and utilities of TIF1 are found in John Hopkins OMIM database record ID 603406, and in cited publications numbered 5297, 5298-5299, 620 and 11302 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ14855 (Accession NM_033210) is another VGAM108 host target gene. FLJ14855 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14855, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14855 BINDING SITE, designated SEQ ID:27058, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9259] Another function of VGAM108 is therefore inhibition of FLJ14855 (Accession NM_033210). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14855. FLJ23462 (Accession NM_024843) is another VGAM108 host target gene. FLJ23462 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ23462, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23462 BINDING SITE, designated SEQ ID:24263, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9260] Another function of VGAM108 is therefore inhibition of FLJ23462 (Accession NM_024843). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23462. Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130) is another VGAM108 host target gene. GOLPH3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GOLPH3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLPH3 BINDING SITE, designated SEQ ID:22685, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9261] Another function of VGAM108 is therefore inhibition of Golgi Phosphoprotein 3 (coat-protein) (GOLPH3, Accession NM_022130). Accordingly, utilities of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLPH3. LOC145368 (Accession XM_085112) is another VGAM108 host target gene. LOC145368 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145368, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145368 BINDING SITE, designated SEQ ID:37826, to the nucleotide sequence of VGAM108 RNA, herein designated VGAM RNA, also designated SEQ ID:2819.

[9262] Another function of VGAM108 is therefore inhibition of LOC145368 (Accession XM_085112). Accordingly, utilities

of VGAM108 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145368. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 109 (VGAM109) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9263] VGAM109 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM109 was detected is described hereinabove with reference to Figs. 1–8.

[9264] VGAM109 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Saimiriine Herpesvirus 2. VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9265] VGAM109 gene encodes a VGAM109 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM109 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM109 precursor RNA is designated SEQ ID:95, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:95 is located at position 52022 relative to the genome of Saimiriine Herpesvirus 2.

[9266] VGAM109 precursor RNA folds onto itself, forming VGAM109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9267] An enzyme complex designated DICER COMPLEX, `dices` the VGAM109 folded precursor RNA into VGAM109 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide sequence of VGAM109 RNA is designated SEQ ID:2820, and

is provided hereinbelow with reference to the sequence listing part.

[9268] VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM109 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9269] VGAM109 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM109 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limit-

ing – VGAM109 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9270] The complementary binding of VGAM109 RNA, herein designated VGAM RNA, to host target binding sites on VGAM109 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM109 host target RNA into VGAM109 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9271] It is appreciated that VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM109 host target genes. The mRNA of each one of this plurality of VGAM109 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly com-

plementary to VGAM109 RNA, herein designated VGAM RNA, and which when bound by VGAM109 RNA causes inhibition of translation of respective one or more VGAM109 host target proteins.

[9272] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM109 gene, herein designated VGAM GENE, on one or more VGAM109 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9273] It is yet further appreciated that a function of VGAM109 is inhibition of expression of host target genes, as part of a

novel viral mechanism of attacking a host. Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of viral infection by Saimiriine Herpesvirus 2. Specific functions, and accordingly utilities, of VGAM109 correlate with, and may be deduced from, the identity of the host target genes which VGAM109 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9274] Nucleotide sequences of the VGAM109 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM109 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM109 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM109 are further described hereinbelow with reference to Table 1.

[9275] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM109 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM109 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9276] As mentioned hereinabove with reference to Fig. 1, a

function of VGAM109 gene, herein designated VGAM is inhibition of expression of VGAM109 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM109 correlate with, and may be deduced from, the identity of the target genes which VGAM109 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9277] DKFZp547I094 (Accession NM_032155) is a VGAM109 host target gene. DKFZp547I094 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp547I094, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I094 BINDING SITE, designated SEQ ID:25858, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9278] A function of VGAM109 is therefore inhibition of DKFZp547I094 (Accession NM_032155). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I094. FLJ11996 (Accession NM_024976) is another VGAM109 host target gene. FLJ11996 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ11996, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11996 BINDING SITE, designated SEQ ID:24532, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9279] Another function of VGAM109 is therefore inhibition of FLJ11996 (Accession NM_024976). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11996. FLJ32334 (Accession NM_144565) is another VGAM109 host target gene. FLJ32334 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ32334, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ32334 BINDING SITE, designated SEQ ID:29366, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9280] Another function of VGAM109 is therefore inhibition of

FLJ32334 (Accession NM_144565). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ32334. HBP1 (Accession NM_012257) is another VGAM109 host target gene. HBP1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HBP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HBP1 BINDING SITE, designated SEQ ID:14561, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9281] Another function of VGAM109 is therefore inhibition of HBP1 (Accession NM_012257). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HBP1. KIAA0063 (Accession NM_014876) is another VGAM109 host target gene. KIAA0063 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA0063, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of KIAA0063 BINDING SITE, designated SEQ ID:17018, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9282] Another function of VGAM109 is therefore inhibition of KIAA0063 (Accession NM_014876). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0063. LOC221296 (Accession XM_166325) is another VGAM109 host target gene. LOC221296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221296, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221296 BINDING SITE, designated SEQ ID:44172, to the nucleotide sequence of VGAM109 RNA, herein designated VGAM RNA, also designated SEQ ID:2820.

[9283] Another function of VGAM109 is therefore inhibition of LOC221296 (Accession XM_166325). Accordingly, utilities of VGAM109 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221296. Fig. 1 further provides a conceptual descrip-

tion of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 110 (VGAM110) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9284] VGAM110 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM110 was detected is described hereinabove with reference to Figs. 1–8.

[9285] VGAM110 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9286] VGAM110 gene encodes a VGAM110 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM110 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM110 precursor RNA is designated SEQ ID:96, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:96 is

located at position 161841 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9287] VGAM110 precursor RNA folds onto itself, forming VGAM110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9288] An enzyme complex designated DICER COMPLEX, `dices` the VGAM110 folded precursor RNA into VGAM110 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM110 RNA is designated SEQ ID:2821, and is provided hereinbelow with reference to the sequence listing part.

[9289] VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM110 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9290] VGAM110 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM110 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM110 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in

untranslated regions of a VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9291] The complementary binding of VGAM110 RNA, herein designated VGAM RNA, to host target binding sites on VGAM110 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM110 host target RNA into VGAM110 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9292] It is appreciated that VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM110 host target genes. The mRNA of each one of this plurality of VGAM110 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM110 RNA, herein designated VGAM RNA, and which when bound by VGAM110 RNA causes in-

hibition of translation of respective one or more VGAM110 host target proteins.

[9293] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM110 gene, herein designated VGAM GENE, on one or more VGAM110 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9294] It is yet further appreciated that a function of VGAM110 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM110 include diagnosis, prevention and

treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM110 correlate with, and may be deduced from, the identity of the host target genes which VGAM110 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9295] Nucleotide sequences of the VGAM110 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM110 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM110 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM110 are further described hereinbelow with reference to Table 1.

[9296] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM110 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM110 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9297] As mentioned hereinabove with reference to Fig. 1, a function of VGAM110 gene, herein designated VGAM is

inhibition of expression of VGAM110 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM110 correlate with, and may be deduced from, the identity of the target genes which VGAM110 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9298] Dual Specificity Phosphatase 4 (DUSP4, Accession NM_001394) is a VGAM110 host target gene. DUSP4 BINDING SITE1 and DUSP4 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DUSP4, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DUSP4 BINDING SITE1 and DUSP4 BINDING SITE2, designated SEQ ID:7089 and SEQ ID:27664 respectively, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9299] A function of VGAM110 is therefore inhibition of Dual Specificity Phosphatase 4 (DUSP4, Accession NM_001394), a gene which regulates mitogenic signal transduction. Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions as-

sociated with DUSP4. The function of DUSP4 has been established by previous studies. The VH1 phosphatase encoded by the vaccinia virus is a dual-specificity protein phosphatase that can dephosphorylate both serine/threonine and tyrosine residues. Cellular proteins homologous to VH1 are thought to regulate mitogen-activated protein (MAP) kinases. By screening a placenta library with a DUSP1 (OMIM Ref. No. 600714) cDNA, Guan and Butch (1995) identified cDNAs encoding DUSP4, which they called HVH2. Northern blot analysis revealed that DUSP4 is expressed as 2.5- and 6-kb mRNAs in placenta and, at lower levels, in pancreas. The sequence of the predicted 394-amino acid DUSP4 protein was 62% and 55% identical to those of DUSP1 and PAC1, respectively. Like DUSP1 and DUSP6 (OMIM Ref. No. 602748), the N-terminal region of DUSP4 shares significant identity with CDC25 (OMIM Ref. No. 157680). By immunofluorescence of mammalian cells expressing epitope-tagged protein, Guan and Butch (1995) found that DUSP4 was localized within the nucleus. Purified recombinant DUSP4 specifically hydrolyzed the phosphothreonine and phosphotyrosine residues of the activated MAP kinases ERK1 (OMIM Ref. No. 601795) and ERK2 (OMIM Ref. No. 176948). Expression of DUSP4 in

mammalian cells blocked activation of a MAP kinase-regulated reporter gene. These results led Guan and Butch (1995) to suggest that DUSP4 plays a role in the MAP kinase signal transduction pathway. By fluorescence in situ hybridization, Smith et al. (1997) mapped the DUSP4 gene to 8p12-p11.

[9300] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9301] Guan, K.-L.; Butch, E. : Isolation and characterization of a novel dual specific phosphatase, HVH2, which selectively dephosphorylates the mitogen-activated protein kinase. J. Biol. Chem. 270: 7197-7203, 1995. ; and

[9302] Smith, A.; Price, C.; Cullen, M.; Muda, M.; King, A.; Ozanne, B.; Arkinstall, S.; Ashworth, A. : Chromosomal localization of three human dual specificity phosphatase genes (DUSP4, DUSP6.

[9303] Further studies establishing the function and utilities of DUSP4 are found in John Hopkins OMIM database record ID 602747, and in cited publications numbered 2408-2409 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Fibroblast Growth Factor 13 (FGF13, Accession

NM_033642) is another VGAM110 host target gene.

FGF13 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FGF13, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FGF13 BINDING SITE, designated SEQ ID:27361, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9304] Another function of VGAM110 is therefore inhibition of Fibroblast Growth Factor 13 (FGF13, Accession NM_033642), a gene which probably involved in nervous system development and function. Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FGF13. The function of FGF13 has been established by previous studies. See fibroblast growth factor-12 (FGF12; 601513). By Southern blot hybridization of genomic DNA from rodent/human hybrid cell lines carrying individual human chromosomes, Smallwood et al. (1996) mapped the FGF2 gene (also symbolized FGF13) to the X chromosome. By using an interspecific backcross mapping panel, they

demonstrated that the mouse gene, Fhf2, shows no recombination with the gene for CD40 antigen ligand (OMIM Ref. No. 300386). Thus the human gene is probably located at Xq26. By use of isotopic in situ hybridization, Lovec et al. (1997) assigned the FHF2 gene to Xq21. Gecz et al. (1999), however, provided evidence that the FHF2 gene is located in Xq26.3. They identified a male patient with features of Borjeson–Forssman–Lehmann syndrome (BFLS; 301900) and a duplication of the Xq26–q28 region. By FISH using YAC clones from Xq26, they localized the duplication breakpoint to an interval of approximately 400 kb in the Xq26.3 region between DXS155 and DXS294/DXS730. Database searches and an analysis of available genomic sequence from the region showed that the FHF2 gene is located within the duplication breakpoint interval. Gecz et al. (1999) determined the structure of the FHF2 gene and identified 2 new exons, including a new 5–prime end exon, designated 1B. FHF2 is a large gene, extending over approximately 200 kb in Xq26.3, and contains at least 7 exons. It shows tissue–specific alternative splicing and alternative transcription starts. Northern blot hybridization showed highest expression in brain and skeletal muscle. The localization and tissue–specific ex–

pression pattern of FHF2 made it a possible candidate gene for familial cases of BFLS and for other syndromal and nonspecific forms of X-linked mental retardation mapping to that region.

[9305] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9306] Gecz, J.; Baker, E.; Donnelly, A.; Ming, J. E.; McDonald-McGinn, D. M.; Spinner, N. B.; Zackai, E. H.; Sutherland, G. R.; Mulley, J. C. : Fibroblast growth factor homologous factor 2 (FHF2): gene structure, expression and mapping to the Borjeson-Forssman-Lehmann syndrome region in Xq26 delineated by a duplication breakpoint in a BFLS-like patient. Hum. Genet. 104: 56-63, 1999. ; and

[9307] Lovec, H.; Hartung, H.; Verdier, A.-S.; Mattei, M.-G.; Birnbaum, D.; Goldfarb, M.; Coulier, F. : Assignment of FGF13 to human chromosome band Xq21 by in situ hybridization. Cytogenet.

[9308] Further studies establishing the function and utilities of FGF13 are found in John Hopkins OMIM database record ID 300070, and in cited publications numbered 9084-9086 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. IQ Motif

Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633) is another VGAM110 host target gene. IQGAP2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by IQGAP2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IQGAP2 BINDING SITE, designated SEQ ID:13427, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9309] Another function of VGAM110 is therefore inhibition of IQ Motif Containing GTPase Activating Protein 2 (IQGAP2, Accession NM_006633), a gene which Inhibits GTPase activity of Cdc42 and Rac1. Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IQGAP2. The function of IQGAP2 has been established by previous studies. Sugimoto et al. (2001) demonstrated that IQGAP1, a negative regulator of cell-cell adhesion, is upregulated by gene amplification at 15q26 in 2 gastric cancer cell lines. Amplification at 15q26 had been found in various malignancies, including breast cancers, and FES (OMIM Ref. No.

190030) and/or IGF1R (OMIM Ref. No. 147370) had been identified as targets for gene amplification in breast cancer, melanoma, and pancreatic adenocarcinoma. In contrast, Sugimoto et al. (2001) found that both genes are located telomeric to the amplicon at 15q26 in the 2 gastric cancer cell lines they studied. Fukata et al. (2002) found that IQGAP1, an effector of RAC1 (OMIM Ref. No. 602048) and CDC42, interacts with CLIP170 (RSN; 179838). In Vero fibroblasts, IQGAP1 localized at the polarized leading edge. Expression of a C-terminal fragment of IQGAP1 that included the CLIP170-binding region delocalized GFP-CLIP170 from the tips of microtubules and altered the microtubule array. The authors found that activated RAC1/CDC42, IQGAP1, and CLIP170 form a tripartite complex. Furthermore, expression of an IQGAP1 mutant defective in RAC1/CDC42 binding induced multiple leading edges. These results indicated that RAC1/CDC42 marks special cortical spots where the IQGAP1 and CLIP170 complex is targeted, leading to a polarized microtubule array and cell polarization.

[9310] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9311] Sugimoto, N.; Imoto, I.; Fukuda, Y.; Kurihara, N.; Kuroda, S.; Tanigami, A.; Kaibuchi, K.; Kamiyama, R.; Inazawa, J. : IQGAP1, a negative regulator of cell–cell adhesion, is up-regulated by gene amplification at 15q26 in gastric cancer cell lines HSC39 and 40A. J. Hum. Genet. 46: 21–25, 2001. ; and

[9312] Fukata, M.; Watanabe, T.; Noritake, J.; Nakagawa, M.; Yamaga, M.; Kuroda, S.; Matsuura, Y.; Iwamatsu, A.; Perez, F.; Kaibuchi, K. : Rac1 and Cdc42 capture microtubules through IQGAP1 an.

[9313] Further studies establishing the function and utilities of IQGAP2 are found in John Hopkins OMIM database record ID 605401, and in cited publications numbered 7315 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Interleukin–1 Receptor–associated Kinase 1 (IRAK1, Accession NM_001569) is another VGAM110 host target gene. IRAK1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by IRAK1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of IRAK1 BINDING SITE, designated SEQ ID:7297, to the nu–

cleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9314] Another function of VGAM110 is therefore inhibition of Interleukin-1 Receptor-associated Kinase 1 (IRAK1, Accession NM_001569). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with IRAK1. Kelch-like 2, Mayven (Drosophila) (KLHL2, Accession NM_007246) is another VGAM110 host target gene. KLHL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL2 BINDING SITE, designated SEQ ID:14111, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9315] Another function of VGAM110 is therefore inhibition of Kelch-like 2, Mayven (Drosophila) (KLHL2, Accession NM_007246). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KLHL2. Oligophrenin 1 (OPHN1, Accession NM_002547) is another VGAM110 host

target gene. OPHN1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by OPHN1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OPHN1 BINDING SITE, designated SEQ ID:8399, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9316] Another function of VGAM110 is therefore inhibition of Oligophrenin 1 (OPHN1, Accession NM_002547). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OPHN1. Williams-Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170) is another VGAM110 host target gene. WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WBSCR1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WBSCR1 BINDING SITE1 and WBSCR1 BINDING SITE2, designated SEQ ID:22725 and SEQ ID:25708

respectively, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9317] Another function of VGAM110 is therefore inhibition of Williams–Beuren Syndrome Chromosome Region 1 (WBSCR1, Accession NM_022170), a gene which stimulates protein translation. Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with WBSCR1. The function of WBSCR1 has been established by previous studies. Williams–Beuren syndrome (WBS; 194050) is a multisystem developmental disorder caused by the deletion of contiguous genes at 7q11.23. Osborne et al. (1996) characterized a 500–kb region in 7q11.23 that was deleted in a collection of 30 WBS patients. They constructed a detailed physical map of the region consisting of cosmids, P1 artificial chromosomes, and yeast artificial chromosomes. They identified 9 transcription units from the area, including the previously characterized genes ELN (OMIM Ref. No. 130160), LIMK1 (OMIM Ref. No. 601329), and RFC2 (OMIM Ref. No. 600404), and the novel genes WSCR1 and WSCR4 (OMIM Ref. No. 603432). The WSCR1 gene has 6 exons which contain an open reading frame

encoding 232 amino acids, including an RNA-binding domain consensus sequence. Northern blot analysis detected a 2.5-kb WBSCR1 transcript in all human cell lines analyzed. Richter-Cook et al. (1998) identified the eukaryotic initiation factor (EIF) 4H protein from rabbit reticulocyte lysate on the basis of its ability to stimulate translation in an in vitro globin synthesis assay deficient in EIF4B (OMIM Ref. No. 603928) and EIF4F. Amino acid sequence analysis of 3 EIF4H tryptic fragments revealed 100% sequence identity to the human WBSCR1 protein. The authors demonstrated that the 25-kD rabbit EIF4H protein stimulates the in vitro activities of EIF4B and EIF4F in globin synthesis, as well as the in vitro RNA-dependent ATPase activities of EIF4A (e.g., 601102), EIF4B, and EIF4F.

[9318] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9319] Osborne, L. R.; Martindale, D.; Scherer, S. W.; Shi, X.-M.; Huizenga, J.; Heng, H. H. Q.; Costa, T.; Pober, B.; Lew, L.; Brinkman, J.; Rommens, J.; Koop, B.; Tsui, L.-C. : Identification of genes from a 500-kb region at 7q11.23 that is commonly deleted in Williams syndrome patients. *Genomics* 36: 328-336, 1996. ; and

[9320] Richter–Cook, N. J.; Dever, T. E.; Hensold, J. O.; Merrick, W. C. : Purification and characterization of a new eukaryotic protein translation factor: eukaryotic initiation factor 4H. J.

[9321] Further studies establishing the function and utilities of WBSCR1 are found in John Hopkins OMIM database record ID 603431, and in cited publications numbered 10456 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP–GlcNAc:betaGal Beta–1,3–N–acetylglucosaminyltransferase 5 (B3GNT5, Accession NM_032047) is another VGAM110 host target gene. B3GNT5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by B3GNT5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GNT5 BINDING SITE, designated SEQ ID:25763, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9322] Another function of VGAM110 is therefore inhibition of UDP–GlcNAc:betaGal Beta–

1,3-N-acetylglucosaminyltransferase 5 (B3GNT5, Accession NM_032047). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GNT5. FEM-2 (Accession NM_014634) is another VGAM110 host target gene. FEM-2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FEM-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FEM-2 BINDING SITE, designated SEQ ID:16005, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9323] Another function of VGAM110 is therefore inhibition of FEM-2 (Accession NM_014634). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FEM-2. FLJ11259 (Accession NM_018370) is another VGAM110 host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20380, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9324] Another function of VGAM110 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ14437 (Accession NM_032578) is another VGAM110 host target gene. FLJ14437 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ14437, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14437 BINDING SITE, designated SEQ ID:26305, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9325] Another function of VGAM110 is therefore inhibition of FLJ14437 (Accession NM_032578). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14437.

KIAA0459 (Accession XM_027862) is another VGAM110 host target gene. KIAA0459 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0459, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0459 BINDING SITE, designated SEQ ID:30570, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9326] Another function of VGAM110 is therefore inhibition of KIAA0459 (Accession XM_027862). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0459. KIAA0547 (Accession NM_014793) is another VGAM110 host target gene. KIAA0547 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0547, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0547 BINDING SITE, designated SEQ ID:16697, to the nucleotide sequence of VGAM110 RNA, herein designated

VGAM RNA, also designated SEQ ID:2821.

[9327] Another function of VGAM110 is therefore inhibition of KIAA0547 (Accession NM_014793). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0547. KIAA1762 (Accession XM_033370) is another VGAM110 host target gene. KIAA1762 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1762, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1762 BINDING SITE, designated SEQ ID:31908, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9328] Another function of VGAM110 is therefore inhibition of KIAA1762 (Accession XM_033370). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1762. KIAA1951 (Accession XM_057401) is another VGAM110 host target gene. KIAA1951 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1951, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1951 BINDING SITE, designated SEQ ID:36511, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9329] Another function of VGAM110 is therefore inhibition of KIAA1951 (Accession XM_057401). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1951. LOC145900 (Accession XM_085276) is another VGAM110 host target gene. LOC145900 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC145900, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145900 BINDING SITE, designated SEQ ID:38010, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9330] Another function of VGAM110 is therefore inhibition of LOC145900 (Accession XM_085276). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC145900. LOC150933 (Accession XM_097971) is another VGAM110 host target gene. LOC150933 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC150933, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150933 BINDING SITE, designated SEQ ID:41269, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9331] Another function of VGAM110 is therefore inhibition of LOC150933 (Accession XM_097971). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150933. LOC152876 (Accession XM_098279) is another VGAM110 host target gene. LOC152876 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC152876, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152876 BINDING SITE, designated SEQ ID:41559, to

the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9332] Another function of VGAM110 is therefore inhibition of LOC152876 (Accession XM_098279). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152876. LOC254936 (Accession XM_170770) is another VGAM110 host target gene. LOC254936 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254936, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254936 BINDING SITE, designated SEQ ID:45525, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9333] Another function of VGAM110 is therefore inhibition of LOC254936 (Accession XM_170770). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254936. LOC256867 (Accession XM_170694) is another VGAM110 host target gene. LOC256867 BINDING SITE is HOST TARGET binding site found in the 5' un-

translated region of mRNA encoded by LOC256867, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC256867 BINDING SITE, designated SEQ ID:45469, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9334] Another function of VGAM110 is therefore inhibition of LOC256867 (Accession XM_170694). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC256867. LOC90190 (Accession XM_029758) is another VGAM110 host target gene. LOC90190 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90190, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90190 BINDING SITE, designated SEQ ID:30944, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9335] Another function of VGAM110 is therefore inhibition of LOC90190 (Accession XM_029758). Accordingly, utilities

of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90190. LOC90639 (Accession XM_033092) is another VGAM110 host target gene. LOC90639 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC90639, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90639 BINDING SITE, designated SEQ ID:31831, to the nucleotide sequence of VGAM110 RNA, herein designated VGAM RNA, also designated SEQ ID:2821.

[9336] Another function of VGAM110 is therefore inhibition of LOC90639 (Accession XM_033092). Accordingly, utilities of VGAM110 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90639. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 111 (VGAM111) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9337] VGAM111 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM111 was detected is described hereinabove with reference to Figs. 1–8.

[9338] VGAM111 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9339] VGAM111 gene encodes a VGAM111 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM111 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM111 precursor RNA is designated SEQ ID:97, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:97 is located at position 193387 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9340] VGAM111 precursor RNA folds onto itself, forming VGAM111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional

`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9341] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM111 folded precursor RNA into VGAM111 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 41%) nucleotide se-
quence of VGAM111 RNA is designated SEQ ID:2822, and
is provided hereinbelow with reference to the sequence
listing part.

[9342] VGAM111 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM111 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM111 host target RNA comprises
three regions, as is typical of mRNA of a protein coding
gene: a 5` untranslated region, a protein coding region

and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9343] VGAM111 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM111 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM111 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR

and 5`UTR regions.

[9344] The complementary binding of VGAM111 RNA, herein designated VGAM RNA, to host target binding sites on VGAM111 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM111 host target RNA into VGAM111 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9345] It is appreciated that VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM111 host target genes. The mRNA of each one of this plurality of VGAM111 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM111 RNA, herein designated VGAM RNA, and which when bound by VGAM111 RNA causes inhibition of translation of respective one or more VGAM111 host target proteins.

[9346] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM111 gene, herein designated VGAM GENE, on one or

more VGAM111 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9347] It is yet further appreciated that a function of VGAM111 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM111 correlate with, and may be deduced from, the identity of the host target genes which VGAM111 binds and inhibits, and the function of these host target genes, as elaborated herein-

below.

- [9348] Nucleotide sequences of the VGAM111 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM111 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM111 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM111 are further described hereinbelow with reference to Table 1.
- [9349] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM111 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM111 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9350] As mentioned hereinabove with reference to Fig. 1, a function of VGAM111 gene, herein designated VGAM is inhibition of expression of VGAM111 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM111 correlate with, and may be deduced from, the identity of the target genes which VGAM111 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9351] Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834) is a VGAM111 host target gene. GRIN2B BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GRIN2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2B BINDING SITE, designated SEQ ID:6492, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9352] A function of VGAM111 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2B (GRIN2B, Accession NM_000834). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN2B. Potassium Large Conductance Calcium-activated Channel, Subfamily M Beta Member 3 (KCNMB3, Accession NM_014407) is another VGAM111 host target gene. KCNMB3 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KCNMB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of KCNMB3 BINDING SITE, designated SEQ ID:15748, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9353] Another function of VGAM111 is therefore inhibition of Potassium Large Conductance Calcium-activated Channel, Subfamily M Beta Member 3 (KCNMB3, Accession NM_014407), a gene which is similar to a regulatory subunit of Ca-activated potassium channel. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNMB3. The function of KCNMB3 has been established by previous studies. The large conductance, calcium-activated potassium (BK) channel is a member of the Shaker-related 6-transmembrane domain potassium channel superfamily that is sensitive to voltage and calcium. BK channels are composed of a pore-forming alpha subunit (KCNMA1, or HSLO; 600150) and, in some tissues, a beta subunit. The beta-1 subunit (KCNMB1; 603951) is expressed predominantly in smooth muscle cells, whereas the beta-2 subunit (KCNMB2; 605214) is expressed in endocrine tissue, such as adrenal chromaffin cells Uebele et

al. (2000) determined that KCNMB3 is a family of 4 related subunits, KCNMB3a (277 amino acids), KCNMB3b (257 amino acids), KCNMB3c (275 amino acids), and KCNMB3d (279 amino acids), that arise from alternative splicing. The subunits vary only in their cytoplasmic N-terminal sequences and share 256 C-terminal amino acids. Genomic sequence analysis determined that the KCNMB3 gene contains 6 exons, 3 of which (1a, 1b, and 1c/d) encode sequences unique to each of the splice variants. RT-PCR analysis showed that KCNMB3a has a relatively restricted distribution (spleen, placenta, pancreas, kidney, and heart), while the other variants are more widely expressed. KCNMB3c was notably abundant in pancreas. In situ hybridization analysis demonstrated that KCNMB3c expression is restricted to pancreatic beta cells. Coexpression of KCNMB3a, -b, and -c with KCNMA1 resulted in partial inactivation of activating currents; KCNMB3d did not induce detectable inactivation. By FISH and somatic cell hybrid analysis, Riazi et al. (1999) mapped the KCNMB3 gene to 3q26.3-q27. Uebele et al. (2000) also mapped the KCNMB3 gene to 3q26.3-q27.1, in close proximity to KCNMB2, by radiation hybrid and FISH analysis

- [9354] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9355] Behrens, R.; Nolting, A.; Reimann, F.; Schwarz, M.; Waldschütz, R.; Pongs, O. : hKCNMB3 and hKCNMB4, cloning and characterization of two members of the large-conductance calcium-activated potassium channel beta subunit family. FEBS Lett. 474: 99–106, 2000. ; and
- [9356] Brenner, R.; Jegla, T. J.; Wickenden, A.; Liu, Y.; Aldrich, R. W. : Cloning and functional characterization of novel large conductance calcium-activated potassium channel beta subunits.
- [9357] Further studies establishing the function and utilities of KCNMB3 are found in John Hopkins OMIM database record ID 605222, and in cited publications numbered 6974–697 and 6965 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Membrane-spanning 4-domains, Subfamily A, Member 3 (hematopoietic cell-specific) (MS4A3, Accession NM_006138) is another VGAM111 host target gene. MS4A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MS4A3, corresponding to a HOST TARGET binding site

such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MS4A3 BINDING SITE, designated SEQ ID:12779, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9358] Another function of VGAM111 is therefore inhibition of Membrane-spanning 4-domains, Subfamily A, Member 3 (hematopoietic cell-specific) (MS4A3, Accession NM_006138). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MS4A3. Neuronal Pentraxin I (NPTX1, Accession NM_002522) is another VGAM111 host target gene. NPTX1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NPTX1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NPTX1 BINDING SITE, designated SEQ ID:8353, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9359] Another function of VGAM111 is therefore inhibition of

Neuronal Pentraxin I (NPTX1, Accession NM_002522), a gene which may be involved in synaptic uptake of extracellular material and is very strongly similar to rat NP1. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NPTX1. The function of NPTX1 has been established by previous studies. See 600750. Neuronal pentraxin I (NP1) was identified in the rat as a binding protein for the snake venom toxin taipoxin (Schlimgen et al., 1995). Omeis et al. (1996) cloned the human NP1 homolog by screening a human cerebellar cDNA library with the rat NP1 gene as a probe. The gene, designated NPTX1, encodes a predicted 430-amino acid protein that is 95% identical to rat NP1. Northern blot analysis showed that the approximately 6-kb NPTX1 mRNA is expressed only in the brain. Omeis et al. (1996) used fluorescence in situ hybridization to map the NPTX1 gene to human chromosome 17q25.1-q25.2 and mouse chromosome 11e2-e1.3.

[9360] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9361] Omeis, I. A.; Hsu, Y.-C.; Perin, M. S. : Mouse and human

neuronal pentraxin 1 (NPXT1): conservation, genomic structure, and chromosomal localization. Genomics 36: 543–545, 1996. ; and

[9362] Schlimgen, A. K.; Helms, J. A.; Vogel, H.; Perin, M. S. : Neuronal pentraxin, a secreted protein with homology to acute phase proteins of the immune system. Neuron 14: 519–526, 1995.

[9363] Further studies establishing the function and utilities of NPTX1 are found in John Hopkins OMIM database record ID 602367, and in cited publications numbered 8933 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198) is another VGAM111 host target gene. PDK4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDK4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDK4 BINDING SITE, designated SEQ ID:46441, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9364] Another function of VGAM111 is therefore inhibition of

Pyruvate Dehydrogenase Kinase, Isoenzyme 4 (PDK4, Accession XM_173198). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDK4. Selectin P (granule membrane protein 140kDa, antigen CD62) (SELP, Accession NM_003005) is another VGAM111 host target gene. SELP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SELP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SELP BINDING SITE, designated SEQ ID:8913, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9365] Another function of VGAM111 is therefore inhibition of Selectin P (granule membrane protein 140kDa, antigen CD62) (SELP, Accession NM_003005), a gene which mediates the interaction of activated endothelial cells or platelets with leukocytes. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SELP. The function of SELP has been established by previous studies. P-selectin, also called GMP-140, CD62, or selectin P, is a

140-kD adhesion molecule, expressed at the surface of activated cells, that mediates the interaction of activated endothelial cells or platelets with leukocytes. McEver et al. (1989) used an immunoperoxidase procedure to examine the distribution of GMP-140 in human tissues. The protein was detected in megakaryocytes and platelets, as well as in vascular endothelial cells, but was not found in a variety of other cell types examined. In endothelial cells, the protein was localized to the membranes of Weibel-Palade bodies, the intracellular storage granules for von Willebrand factor. The gene for GMP-140 was cloned by Johnston et al. (1989). Johnston et al. (1990) found that the GMP140 gene spans over 50 kb and contains 17 exons. CD24 is a ligand for P-selectin; see 600074. Animal model experiments lend further support to the function of SELP. Mayadas et al. (1993) generated P-selectin-deficient mice by gene targeting in embryonic stem cells and found that they exhibited a number of defects in leukocyte behavior, including elevated numbers of circulating neutrophils, virtually total absence of leukocyte rolling in mesenteric venules, and delayed recruitment of neutrophils to the peritoneal cavity upon experimentally induced inflammation.

[9366] It is appreciated that the abovementioned animal model for SELP is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9367] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9368] McEver, R. P.; Beckstead, J. H.; Moore, K. L.; Marshall-Carlson, L.; Bainton, D. F. : GMP-140, a platelet alpha-granule membrane protein, is also synthesized by vascular endothelial cells and is localized in Weibel-Palade bodies. J. Clin. Invest. 84: 92-99, 1989. ; and

[9369] Herrmann, S.-M.; Ricard, S.; Nicaud, V.; Mallet, C.; Evans, A.; Ruidavets, J.-B.; Arveiler, D.; Luc, G.; Cambien, F. : The P-selectin gene is highly polymorphic: reduced frequency of the.

[9370] Further studies establishing the function and utilities of SELP are found in John Hopkins OMIM database record ID 173610, and in cited publications numbered 11805-1710, 2123, 1150 and 11810 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695) is another VGAM111

host target gene. VANGL2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by VANGL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of VANGL2 BINDING SITE, designated SEQ ID:35481, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9371] Another function of VGAM111 is therefore inhibition of Vang-like 2 (van gogh, Drosophila) (VANGL2, Accession XM_049695), a gene which may take part in defining the lateral boundary of floorplate differentiation. Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with VANGL2. The function of VANGL2 has been established by previous studies. Murdoch et al. (2001) independently cloned the causative gene for craniorachischisis in Lp mice, which they named Lpp1. A single base transition, 1841G→A, resulted in a ser464→asn substitution. Lpp1 is expressed in the ventral part of the developing neural tube, but is excluded from the floorplate where Sonic hedgehog (Shh; 600725) is expressed. Embryos

lacking Shh express Lpp1 throughout the ventral neural tube, suggesting negative regulation of Lpp1 by Shh. The authors suggested that the mutual interaction between Lpp1 and Shh may define the lateral boundary of floor-plate differentiation. They hypothesized that loss of Lpp1 function may disrupt neurulation by permitting more extensive floorplate induction by Shh, thereby inhibiting midline bending of the neural plate during initiation of neurulation. The human ortholog of Lpp1, which maps to chromosome 1, shares 89% identity with the mouse gene at the nucleotide level and 99% identity at the amino acid level. Animal model experiments lend further support to the function of VANGL2. 'Loop-tail' (Lp) is a semidominant mouse mutation that, in homozygous mutants, causes a severe form of neural tube defect called craniorachischisis. Heterozygous mice exhibit a characteristic looped tail, and homozygous embryos show a completely open neural tube in the hindbrain and spinal region. Kibar et al. (2001) used a positional cloning approach to identify the Lp gene. By an in silico search, the authors identified a mouse EST within the Lp interval homologous to a partial human cDNA clone KIAA1215. Based on its relationship to the mouse disorder, Kibar et al. (2001) used the tempo-

rary designation 'loop-tail-associated protein' (Ltap). The Ltap gene encodes a homolog of *Drosophila* 'strabismus/Van Gogh' (Stbm/Vang), a component of the frizzled-disheveled tissue polarity pathway. Ltap is expressed broadly in the neuroectoderm throughout early neurogenesis. This and the fact that the gene was altered in 2 independent Lp alleles identified it as the likely basis for loop-tail. The authors suggested that the human Ltap homolog is worthy of search for mutations that may be associated with sporadic or familial cases of neural tube defects in humans.

[9372] It is appreciated that the abovementioned animal model for VANGL2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9373] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9374] Murdoch, J. N.; Doudney, K.; Paternotte, C.; Copp, A. J.; Stanier, P. : Severe neural tube defects in the loop-tail mouse result from mutation of Lpp1, a novel gene involved in floor plate specification. *Hum. Molec. Genet.* 10: 2593–2601, 2001. ; and

- [9375] Kibar, Z.; Vogan, K. J.; Groulx, N.; Justice, M. J.; Underhill, D. A.; Gros, P. : Ltap, a mammalian homolog of Drosophila Strabismus/Van Gogh, is altered in the mouse neural tube mutant lo.
- [9376] Further studies establishing the function and utilities of VANGL2 are found in John Hopkins OMIM database record ID 600533, and in cited publications numbered 7767–7771 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. ADMP (Accession NM_145035) is another VGAM111 host target gene. ADMP BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADMP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADMP BINDING SITE, designated SEQ ID:29656, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.
- [9377] Another function of VGAM111 is therefore inhibition of ADMP (Accession NM_145035). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADMP. V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein

kinase B, gamma) (AKT3, Accession NM_005465) is another VGAM111 host target gene. AKT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AKT3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AKT3 BINDING SITE, designated SEQ ID:11958, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9378] Another function of VGAM111 is therefore inhibition of V-akt Murine Thymoma Viral Oncogene Homolog 3 (protein kinase B, gamma) (AKT3, Accession NM_005465). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AKT3. Aquaporin 9 (AQP9, Accession NM_020980) is another VGAM111 host target gene. AQP9 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AQP9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AQP9 BINDING SITE, designated SEQ ID:21967, to the nu-

cleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9379] Another function of VGAM111 is therefore inhibition of Aquaporin 9 (AQP9, Accession NM_020980). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AQP9. ATPase, Class II, Type 9A (ATP9A, Accession XM_030577) is another VGAM111 host target gene. ATP9A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ATP9A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ATP9A BINDING SITE, designated SEQ ID:31084, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9380] Another function of VGAM111 is therefore inhibition of ATPase, Class II, Type 9A (ATP9A, Accession XM_030577). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ATP9A. Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605) is another

VGAM111 host target gene. C5orf6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C5orf6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C5orf6 BINDING SITE, designated SEQ ID:18703, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9381] Another function of VGAM111 is therefore inhibition of Chromosome 5 Open Reading Frame 6 (C5orf6, Accession NM_016605). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C5orf6. FLJ10769 (Accession NM_018210) is another VGAM111 host target gene. FLJ10769 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10769, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10769 BINDING SITE, designated SEQ ID:20114, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ

ID:2822.

[9382] Another function of VGAM111 is therefore inhibition of FLJ10769 (Accession NM_018210). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10769. FLJ12572 (Accession NM_022905) is another VGAM111 host target gene. FLJ12572 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23199, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9383] Another function of VGAM111 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. FLJ14624 (Accession XM_049060) is another VGAM111 host target gene. FLJ14624 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ14624, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14624 BINDING SITE, designated SEQ ID:35337, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9384] Another function of VGAM111 is therefore inhibition of FLJ14624 (Accession XM_049060). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14624. Formin Binding Protein 3 (FNBP3, Accession XM_087118) is another VGAM111 host target gene. FNBP3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FNBP3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FNBP3 BINDING SITE, designated SEQ ID:39073, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9385] Another function of VGAM111 is therefore inhibition of Formin Binding Protein 3 (FNBP3, Accession XM_087118). Accordingly, utilities of VGAM111 include diagnosis, pre-

vention and treatment of diseases and clinical conditions associated with FNBP3. KIAA0087 (Accession NM_014769) is another VGAM111 host target gene. KIAA0087 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0087, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0087 BINDING SITE, designated SEQ ID:16558, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9386] Another function of VGAM111 is therefore inhibition of KIAA0087 (Accession NM_014769). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0087. KIAA0335 (Accession NM_014803) is another VGAM111 host target gene. KIAA0335 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0335, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0335 BINDING SITE, designated SEQ ID:16727, to the

nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9387] Another function of VGAM111 is therefore inhibition of KIAA0335 (Accession NM_014803). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0335. KIAA1671 (Accession XM_037809) is another VGAM111 host target gene. KIAA1671 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1671, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1671 BINDING SITE, designated SEQ ID:32693, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9388] Another function of VGAM111 is therefore inhibition of KIAA1671 (Accession XM_037809). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1671. MGC14836 (Accession NM_033412) is another VGAM111 host target gene. MGC14836 BINDING SITE is HOST TARGET binding site found in the 5' untranslated

region of mRNA encoded by MGC14836, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC14836 BINDING SITE, designated SEQ ID:27235, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9389] Another function of VGAM111 is therefore inhibition of MGC14836 (Accession NM_033412). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC14836. MGC16385 (Accession NM_145039) is another VGAM111 host target gene. MGC16385 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MGC16385, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16385 BINDING SITE, designated SEQ ID:29662, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9390] Another function of VGAM111 is therefore inhibition of MGC16385 (Accession NM_145039). Accordingly, utilities

of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16385. MGC20235 (Accession NM_145041) is another VGAM111 host target gene. MGC20235 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC20235, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC20235 BINDING SITE, designated SEQ ID:29666, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9391] Another function of VGAM111 is therefore inhibition of MGC20235 (Accession NM_145041). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC20235. p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168) is another VGAM111 host target gene. PAK6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PAK6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se-

quences of PAK6 BINDING SITE, designated SEQ ID:21386, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9392] Another function of VGAM111 is therefore inhibition of p21(CDKN1A)-activated Kinase 6 (PAK6, Accession NM_020168). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PAK6. PDZ-GEF1 (Accession NM_014247) is another VGAM111 host target gene. PDZ-GEF1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDZ-GEF1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDZ-GEF1 BINDING SITE, designated SEQ ID:15522, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9393] Another function of VGAM111 is therefore inhibition of PDZ-GEF1 (Accession NM_014247). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDZ-GEF1. PRO0641 (Accession NM_014135) is another

VGAM111 host target gene. PRO0641 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRO0641, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0641 BINDING SITE, designated SEQ ID:15400, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9394] Another function of VGAM111 is therefore inhibition of PRO0641 (Accession NM_014135). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0641. PRO1430 (Accession NM_018599) is another VGAM111 host target gene. PRO1430 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1430 BINDING SITE, designated SEQ ID:20674, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9395] Another function of VGAM111 is therefore inhibition of PRO1430 (Accession NM_018599). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1430. Regulator of G-protein Signalling 20 (RGS20, Accession NM_003702) is another VGAM111 host target gene. RGS20 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RGS20, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RGS20 BINDING SITE, designated SEQ ID:9802, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9396] Another function of VGAM111 is therefore inhibition of Regulator of G-protein Signalling 20 (RGS20, Accession NM_003702). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RGS20. SKI-like (SKIL, Accession NM_005414) is another VGAM111 host target gene. SKIL BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by SKIL, corresponding to a HOST TARGET binding site such

as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SKIL BINDING SITE, designated SEQ ID:11883, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9397] Another function of VGAM111 is therefore inhibition of SKI-like (SKIL, Accession NM_005414). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SKIL. Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM_030777) is another VGAM111 host target gene. SLC2A10 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC2A10, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC2A10 BINDING SITE, designated SEQ ID:25063, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9398] Another function of VGAM111 is therefore inhibition of Solute Carrier Family 2 (facilitated glucose transporter), Member 10 (SLC2A10, Accession NM_030777). Accord-

ingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC2A10. LOC149134 (Accession XM_097594) is another VGAM111 host target gene. LOC149134 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149134, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149134 BINDING SITE, designated SEQ ID:40959, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9399] Another function of VGAM111 is therefore inhibition of LOC149134 (Accession XM_097594). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149134. LOC91549 (Accession XM_039115) is another VGAM111 host target gene. LOC91549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC91549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

LOC91549 BINDING SITE, designated SEQ ID:33013, to the nucleotide sequence of VGAM111 RNA, herein designated VGAM RNA, also designated SEQ ID:2822.

[9400] Another function of VGAM111 is therefore inhibition of LOC91549 (Accession XM_039115). Accordingly, utilities of VGAM111 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC91549. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 112 (VGAM112) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9401] VGAM112 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM112 was detected is described hereinabove with reference to Figs. 1–8.

[9402] VGAM112 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9403] VGAM112 gene encodes a VGAM112 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM112 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM112 precursor RNA is designated SEQ ID:98, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:98 is located at position 52615 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9404] VGAM112 precursor RNA folds onto itself, forming VGAM112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9405] An enzyme complex designated DICER COMPLEX, `dices` the VGAM112 folded precursor RNA into VGAM112 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 61%) nucleotide sequence of VGAM112 RNA is designated SEQ ID:2823, and is provided hereinbelow with reference to the sequence listing part.

[9406] VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM112 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9407] VGAM112 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM112 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM112 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9408] The complementary binding of VGAM112 RNA, herein designated VGAM RNA, to host target binding sites on VGAM112 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM112 host target RNA into VGAM112 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9409] It is appreciated that VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM112 host target genes. The mRNA of each one of this plurality of VGAM112 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM112 RNA, herein designated VGAM RNA, and which when bound by VGAM112 RNA causes inhibition of translation of respective one or more VGAM112 host target proteins.

[9410] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM112 gene, herein designated VGAM GENE, on one or more VGAM112 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9411] It is yet further appreciated that a function of VGAM112 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM112 correlate with, and may be deduced from, the identity of the host target genes which VGAM112 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9412] Nucleotide sequences of the VGAM112 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM112 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM112 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM112 are further described hereinbelow with reference to Table 1.

[9413] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM112 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM112 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9414] As mentioned hereinabove with reference to Fig. 1, a function of VGAM112 gene, herein designated VGAM is inhibition of expression of VGAM112 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM112 correlate with, and may be deduced from, the identity of the target genes which VGAM112 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9415] Homeo Box A3 (HOXA3, Accession NM_030661) is a VGAM112 host target gene. HOXA3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HOXA3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HOXA3 BINDING SITE, designated SEQ ID:24992, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA,

also designated SEQ ID:2823.

[9416] A function of VGAM112 is therefore inhibition of Homeo Box A3 (HOXA3, Accession NM_030661). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HOXA3. Peripheral Myelin Protein 22 (PMP22, Accession NM_000304) is another VGAM112 host target gene. PMP22 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PMP22, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PMP22 BINDING SITE, designated SEQ ID:5846, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9417] Another function of VGAM112 is therefore inhibition of Peripheral Myelin Protein 22 (PMP22, Accession NM_000304). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PMP22. Cyclin-dependent Kinase-like 2 (CDC2-related kinase) (CDKL2, Accession NM_003948) is another VGAM112 host target gene.

CDKL2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDKL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDKL2 BINDING SITE, designated SEQ ID:10070, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9418] Another function of VGAM112 is therefore inhibition of Cyclin-dependent Kinase-like 2 (CDC2-related kinase) (CDKL2, Accession NM_003948). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDKL2. FLJ21290 (Accession NM_025034) is another VGAM112 host target gene. FLJ21290 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ21290, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ21290 BINDING SITE, designated SEQ ID:24633, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2823.

[9419] Another function of VGAM112 is therefore inhibition of FLJ21290 (Accession NM_025034). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ21290. HSPC065 (Accession NM_014157) is another VGAM112 host target gene. HSPC065 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSPC065, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSPC065 BINDING SITE, designated SEQ ID:15453, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9420] Another function of VGAM112 is therefore inhibition of HSPC065 (Accession NM_014157). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSPC065. KIAA1796 (Accession XM_166146) is another VGAM112 host target gene. KIAA1796 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1796, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1796 BINDING SITE, designated SEQ ID:43963, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9421] Another function of VGAM112 is therefore inhibition of KIAA1796 (Accession XM_166146). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1796. Serine Palmitoyltransferase, Long Chain Base Subunit 2 (SPTLC2, Accession NM_004863) is another VGAM112 host target gene. SPTLC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPTLC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPTLC2 BINDING SITE, designated SEQ ID:11271, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9422] Another function of VGAM112 is therefore inhibition of Serine Palmitoyltransferase, Long Chain Base Subunit 2

(SPTLC2, Accession NM_004863). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPTLC2. ZFD25 (Accession NM_016220) is another VGAM112 host target gene. ZFD25 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ZFD25, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ZFD25 BINDING SITE, designated SEQ ID:18320, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9423] Another function of VGAM112 is therefore inhibition of ZFD25 (Accession NM_016220). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ZFD25. LOC146435 (Accession XM_085465) is another VGAM112 host target gene. LOC146435 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC146435, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complemen-

tarity of the nucleotide sequences of LOC146435 BINDING SITE, designated SEQ ID:38152, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9424] Another function of VGAM112 is therefore inhibition of LOC146435 (Accession XM_085465). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146435. LOC148709 (Accession XM_086281) is another VGAM112 host target gene. LOC148709 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC148709, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC148709 BINDING SITE, designated SEQ ID:38581, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9425] Another function of VGAM112 is therefore inhibition of LOC148709 (Accession XM_086281). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC148709. LOC164955 (Accession XM_092265) is an-

other VGAM112 host target gene. LOC164955 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC164955, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC164955 BINDING SITE, designated SEQ ID:40111, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9426] Another function of VGAM112 is therefore inhibition of LOC164955 (Accession XM_092265). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC164955. LOC219627 (Accession XM_166402) is another VGAM112 host target gene. LOC219627 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219627, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219627 BINDING SITE, designated SEQ ID:44273, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9427] Another function of VGAM112 is therefore inhibition of LOC219627 (Accession XM_166402). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC219627. LOC220906 (Accession XM_166133) is another VGAM112 host target gene. LOC220906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220906 BINDING SITE, designated SEQ ID:43925, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9428] Another function of VGAM112 is therefore inhibition of LOC220906 (Accession XM_166133). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220906. LOC221312 (Accession XM_166314) is another VGAM112 host target gene. LOC221312 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221312, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221312 BINDING SITE, designated SEQ ID:44137, to the nucleotide sequence of VGAM112 RNA, herein designated VGAM RNA, also designated SEQ ID:2823.

[9429] Another function of VGAM112 is therefore inhibition of LOC221312 (Accession XM_166314). Accordingly, utilities of VGAM112 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221312. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 113 (VGAM113) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9430] VGAM113 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM113 was detected is described hereinabove with reference to Figs. 1–8.

[9431] VGAM113 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM113 host

target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9432] VGAM113 gene encodes a VGAM113 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM113 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM113 precursor RNA is designated SEQ ID:99, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:99 is located at position 142719 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9433] VGAM113 precursor RNA folds onto itself, forming VGAM113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9434] An enzyme complex designated DICER COMPLEX, `dices`

the VGAM113 folded precursor RNA into VGAM113 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM113 RNA is designated SEQ ID:2824, and is provided hereinbelow with reference to the sequence listing part.

[9435] VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM113 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9436] VGAM113 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nu-

cleotide sequence of VGAM113 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM113 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9437] The complementary binding of VGAM113 RNA, herein designated VGAM RNA, to host target binding sites on VGAM113 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM113 host target RNA into VGAM113 host target protein, herein desig-

nated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9438] It is appreciated that VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM113 host target genes. The mRNA of each one of this plurality of VGAM113 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM113 RNA, herein designated VGAM RNA, and which when bound by VGAM113 RNA causes inhibition of translation of respective one or more VGAM113 host target proteins.

[9439] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM113 gene, herein designated VGAM GENE, on one or more VGAM113 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are

also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9440] It is yet further appreciated that a function of VGAM113 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM113 correlate with, and may be deduced from, the identity of the host target genes which VGAM113 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9441] Nucleotide sequences of the VGAM113 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM113 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM113 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM113 are further

described hereinbelow with reference to Table 1.

[9442] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM113 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM113 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9443] As mentioned hereinabove with reference to Fig. 1, a function of VGAM113 gene, herein designated VGAM is inhibition of expression of VGAM113 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM113 correlate with, and may be deduced from, the identity of the target genes which VGAM113 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9444] Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM_004349) is a VGAM113 host target gene. CBFA2T1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CBFA2T1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2

illustrates the complementarity of the nucleotide sequences of CBFA2T1 BINDING SITE, designated SEQ ID:10545, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9445] A function of VGAM113 is therefore inhibition of Core-binding Factor, Runt Domain, Alpha Subunit 2; Translocated To, 1; Cyclin D-related (CBFA2T1, Accession NM_004349), a gene which produces a chimeric gene made up of the 5-prime region of the AML1 gene fused to the 3-prime region of the ETO gene through translocation. Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CBFA2T1. The function of CBFA2T1 has been established by previous studies. Wolford and Prochazka (1998) reported that the MTG8 gene contains 13 exons spanning over 87 kb of DNA. They identified cDNAs representing alternatively spliced MTG8 transcripts in which a 155-bp exon (9a) is present. Inclusion of this exon changes the reading frame, resulting in the introduction of a premature stop codon. The encoded truncated proteins lack 177 C-terminal residues, which is the region containing 2 putative zinc finger motifs, the last P/

S/T-rich domain, and a putative alpha-helical coiled-coil structure. Northern blot analysis of human tissues detected an approximately 5.5-kb MTG8 transcript in heart, brain, placenta, lung, skeletal muscle, and pancreas but not in liver or kidney. RT-PCR analysis of a number of human tissues showed highest levels of MTG8 expression in fetal brain, followed by adult brain and heart. Relatively abundant mRNA levels were also found in lung, pituitary, and placenta. When first identified as a partner with AML1 in acute myeloid leukemia (Erickson et al., 1992; Miyoshi et al., 1993), the gene was referred to as MTG8 for 'myeloid translocation gene on 8q22.' Wolford et al. (1998) found that MTG8 mRNAs are expressed at relatively high levels in human adipose tissue. They therefore investigated MTG8 as a candidate gene in obesity, studying the relationship between a highly polymorphic marker in the 3-prime untranslated region of the MTG8 gene and obesity in Pima Indians of Arizona, a population with one of the highest reported rates of obesity. They detected a male-specific association with age-adjusted percentage body fat ($p = 0.0002$), body mass index ($p = 0.01$), waist circumference ($p = 0.008$), and thigh circumference ($p = 0.02$). Comparative analysis of all 13 MTG8 exons in 30

Pimas did not reveal any genetic variants that could explain the association with obesity in males.

[9446] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9447] Wolford, J. K.; Prochazka, M. : Structure and expression of the human MTG8/ETO gene. Gene 212: 103–109, 1998. ; and

[9448] Miyoshi, H.; Kozu, T.; Shimizu, K.; Enomoto, K.; Maseki, N.; Kaneko, Y.; Kamada, N.; Ohki, M. : The t(8;21) translocation in acute myeloid leukemia results in production of an AML1–MTG8.

[9449] Further studies establishing the function and utilities of CBFA2T1 are found in John Hopkins OMIM database record ID 133435, and in cited publications numbered 3447–3448, 3452–3453, 3449–345 and 3454–3459 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glycyl–tRNA Synthetase (GARS, Accession NM_002047) is another VGAM113 host target gene. GARS BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GARS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GARS BINDING SITE, designated SEQ ID:7798, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9450] Another function of VGAM113 is therefore inhibition of Glycyl-tRNA Synthetase (GARS, Accession NM_002047), a gene which functions in protein biosynthesis. Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GARS. The function of GARS has been established by previous studies. Aminoacyl-tRNA synthetases perform an essential function in protein synthesis by catalyzing the esterification of an amino acid to its cognate tRNA. These enzymes are necessarily present in each cell and must properly recognize the tRNA and the amino acid in order to maintain fidelity of translation. From the primary structures, 2 distinct classes of synthetases have been recognized, with similarity of certain structural features, amino acid attachment sites, and other properties between members of a class. Certain aminoacyl-tRNA synthetases are autoantigens in patients with the idiopathic inflammatory myopathies, polymyositis, and dermatomyositis. Au-

to antibodies reactive with synthetases are found almost exclusively in these conditions, with individuals usually having autoantibodies to only a single synthetase. Most commonly they are directed at histidyl-tRNA synthetase (OMIM Ref. No. 142810), labeled 'anti-Jo-1' autoantibodies. Ge et al. (1994) used a cDNA encoding the human form of glycyl-tRNA synthetase for isolation of corresponding cDNAs. Shiba et al. (1994) likewise cloned a class II human glycyl-tRNA synthetase and compared its structure with that of the bacterial counterpart from which it was found to diverge widely. Williams et al. (1995) also cloned the human GARS cDNA. The predicted 685-amino acid protein showed approximately 45% identity to the yeast protein. The recombinantly expressed protein was immunoprecipitated with human serum containing autoantibodies to glycyl-tRNA synthetase and was shown to catalyze the aminoacylation of tRNA.

28790–28797, 1994. ; and

[9453] Nichols, R. C.; Pai, S. I.; Ge, Q.; Targoff, I. N.; Plotz, P. H.; Liu, P. : Localization of two human autoantigen genes by PCR screening and in situ hybridization--Glycyl-tRNA synthetase.

[9454] Further studies establishing the function and utilities of GARS are found in John Hopkins OMIM database record ID 600287, and in cited publications numbered 10119–10122 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Norrie Disease (pseudoglioma) (NDP, Accession NM_000266) is another VGAM113 host target gene. NDP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NDP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NDP BINDING SITE, designated SEQ ID:5811, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9455] Another function of VGAM113 is therefore inhibition of Norrie Disease (pseudoglioma) (NDP, Accession NM_000266), a gene which may be involved in a pathway

that regulates neural cell differentiation and proliferation. Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NDP. The function of NDP has been established by previous studies. Moreira-Filho and Neustein (1979) described 6 brothers with what they viewed as a variant of ND, because microcephaly was present in all. (In some ways the patients resembled those reported by Goldberg and McKusick as discussed in entry 309800.) The pedigree was informative for linkage with Xg; negative lod scores were obtained. Warburg et al. (1965) had demonstrated no linkage with the Xg blood groups. Johnston et al. (1982) described 2 families with 8 affected males--the first families reported from Ireland. Harendra de Silva and de Silva (1988) described an extensively affected family in Sri Lanka. Gal et al. (1985) found close linkage of Norrie disease to the L1.28/TaqI RFLP, DXS7 (maximum lod = 3.50 at theta = 0.00). Thus, ND may be in or slightly proximal to band Xp11.3 and near the retinitis pigmentosa locus (OMIM Ref. No. 312600), which is also linked to DXS7. Gal et al. (1985) found a peak lod score of 4.1 at theta 0.00 for linkage with DXS7; no recombination was found. DXS7 has been localized to

Xp11.3 (or Xp11.3–p11.2). See Bleeker–Wagemakers et al. (1985) for the full data. Gal et al. (1985, 1986) also described a 14-year-old boy with a complex syndrome dominated by Norrie disease who appeared to have a small deletion involving DXS7 as well; seemingly, the deletion had been transmitted through 3 generations. Other features of the complex were severe mental retardation, hypogonadism, growth disturbances, and increased susceptibility to infections. De la Chapelle et al. (1985) found a deletion defined by DXS7 in 4 affected members of a family. Using probe L1.28 in the study of a chorion villus sample, they could show that the male fetus of a carrier woman was unaffected. Kivlin et al. (1987) presented further linkage data. They stated that no recombination had been identified between ND and the DNA marker L1.28; with their data, the total lod score became 5.42. Ohba and Yamashita (1986) presented evidence suggesting that the Norrie disease locus may be on Xp at band Xp11. A female infant with typical clinical and histopathologic features of vitreoretinal dysplasia was found to have a reciprocal translocation at $t(X;10)(p11;p14)$. Her parents and sibs had normal karyotypes. Donnai et al. (1988) found that the DXS7 locus

was deleted in 2 affected brothers; DXS7 is located in Xp11.3. OTC (OMIM Ref. No. 311250), located at Xp21.1, and DXS84, also located at Xp21.1, were intact. Ngo et al. (1988) and Katayama et al. (1988) found the first recombinant between Norrie disease and the DXS7 locus. The addition of their family brought a total of published informative families to 7, with a maximum lod score of 7.58 at a recombination fraction of 0.038. They stated the assignment of the DXS7 locus (defined by probe L1.28) as Xp11.3-p11.2. Ngo et al. (1989) pointed out that a single recombination event had been reported twice (Ngo et al., 1988; Katayama et al., 1988); otherwise, a distorted impression of the distance between the marker and Norrie disease might be given. Gal et al. (1988) described prenatal exclusion with flanking DNA markers. In an addendum, they stated that 3 families with Norrie disease and DXS7 deletion had been reported, bringing the compiled lod score for NDP vs DXS7 linkage to 11.18 at $\theta = 0.00$. Using a RFLP detected by the ornithine amino transferase (OAT)-related DNA sequences that map to Xp (see OMIM Ref. No. 258870), Ngo et al. (1989) found a suggestion of linkage to the Norrie disease locus. In 3 generations of a family with 4 affected males in 3 sibships of 2 genera-

tions, Zhu et al. (1989) demonstrated deletion of 2 loci, DXS7 and DXS77. DNA studies of chorion villus biopsy material from the fetus of an obligatory carrier indicated that the fetus had inherited the normal allele from the carrier mother. This prediction was confirmed on eye examination at age 5 months. Deletions at the DXS7 locus have been detected in 3 other families (de la Chapelle et al., 1985; Gal et al., 1985; Donnai et al., 1988). Diergaarde et al. (1989) further refined the localization of the deletion in a Dutch case of ND. Sims et al. (1989) demonstrated that the Norrie disease gene is distinct from the monoamine oxidase genes, although some males with atypical Norrie disease who have a submicroscopic deletion in the region of the DXS7 locus have been shown to have disruption of the MAOA (OMIM Ref. No. 309850) and MAOB (OMIM Ref. No. 309860) genes. The authors studied genomic DNA from 19 males in 9 families affected with Norrie disease. No deletions or rearrangements in the region of DSX7 or MAOA were observed in the DNA of these patients. Linkage analysis between the NDP gene and the DSX7 or MAOA loci showed no recombination, with a lod score of 2.80 and 2.58 at a theta of 0.0 for MAOA and DSX7, respectively. MAO activities in fibroblasts and

platelets were normal. Although the MAO and NDP loci appear to be distinct, the high level of polymorphism at the MAO locus should prove useful in the molecular diagnosis of the disease. Collins et al. (1992) reported a male with Norrie disease and 2 obligate heterozygous females who were shown to have a submicroscopic deletion involving the Norrie disease locus and the loci for MAOA and MAOB. The propositus was a profoundly retarded, blind male; he also had neurologic abnormalities including myoclonus and stereotypy-habit disorder (persistent stereotypic and self-injurious behavior with a deleterious effect on the patient's adaptation to home and school environments). Both obligate carriers had a normal IQ. In the propositus, MAO activity was undetectable; in the female heterozygotes, the levels were reduced to the range observed in patients receiving MAO-inhibiting antidepressants. One of the carriers, the mother of the propositus, met diagnostic criteria for 'chronic hypomania and schizotypal features.' Lindsay et al. (1992) did linkage studies using a highly informative microsatellite marker, DXS426, which maps proximal to DXS7 in the interval Xp11.4-p11.23. A multiply informative crossover localized the NDP gene proximal to DXS7. In conjunction with infor-

mation from 2 NDP patients who had a deletion for DXS7 but not for DXS426, their data indicated that the NDP gene is between DXS7 and DXS426 on proximal Xp. Wolff et al. (1992) restudied the family with Episkopi blindness originally studied by Taylor et al. (1959). DNA studies revealed no deletion of any of the probes from proximal Xq. Linkage analysis yielded positive lod scores for all informative markers; e.g., with DXS255, maximum lod = 6.54 at $\theta = 0.0$. The findings confirmed that Episkopi blindness and Norrie disease are the same entity. Although Berger et al. (1992) and Chen et al. (1992) could identify no strong homologies with the candidate gene they identified, by studying the number and spacing of cysteine residues, Meindl et al. (1992) later detected homologies between the Norrie disease gene product and a C-terminal domain that is common to a group of proteins including mucins. Furthermore, they characterized 3 missense mutations, replacing evolutionarily conserved cysteines or creating new cysteine codons, emphasizing the functional importance of these sites. These findings and the clinical features of Norrie disease suggested a possible role for the NDP gene in a neuroectodermal cell-cell interaction. Only exons 2 and 3 of the NDP gene are

translated. Exon 2 contains the first 58 codons of the open reading frame. The intron that follows it is roughly 14.5 kb. Exon 3 is the largest exon and contains residues 59–133 of the open reading frame and a 917-bp untranslated 3-prime-region. Chen et al. (1993) isolated genomic DNA clones encompassing the NDP gene which they found spans 28 kb and consists of 3 exons, the first of which is entirely contained within the 5-prime untranslated region. By PCR analysis, they found that expression of the NDP gene is not confined to the eye or to the brain. They found homology with cysteine-rich protein-binding domains of intermediate-early genes implicated in the regulation of cell proliferation. This led them to propose that the NDP molecule likewise may be involved in the pathway that regulates neural cell differentiation and proliferation. Meitinger et al. (1993) reported that sequence pattern searches and 3-dimensional modeling suggested that the Norrie disease protein (NDP) has a tertiary structure similar to that of a transforming growth factor beta (e.g., 190180). The model identified NDP as a member of an emerging family of growth factors containing a cystine knot motif, with direct implications for the physiologic role of NDP.

- [9459] Further studies establishing the function and utilities of NDP are found in John Hopkins OMIM database record ID 310600, and in cited publications numbered 8614-8617, 2931, 8800, 10615-2936, 1867, 2937, 2945, 9179-2940, 10616-2944, 2946-2949, 10697, 8125, 8127-8145, 1469, 8146-8151, 9180-8155, 8363, 8372-837 and 8807-8381 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. FLJ11101 (Accession NM_018322) is another VGAM113 host target gene. FLJ11101 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11101, corresponding to a

HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11101 BINDING SITE, designated SEQ ID:20315, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9460] Another function of VGAM113 is therefore inhibition of FLJ11101 (Accession NM_018322). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11101. FLJ13072 (Accession XM_117117) is another VGAM113 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43236, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9461] Another function of VGAM113 is therefore inhibition of FLJ13072 (Accession XM_117117). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with FLJ13072. FLJ20729 (Accession NM_017953) is another VGAM113 host target gene. FLJ20729 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20729, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20729 BINDING SITE, designated SEQ ID:19658, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9462] Another function of VGAM113 is therefore inhibition of FLJ20729 (Accession NM_017953). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20729. FLJ20802 (Accession NM_017959) is another VGAM113 host target gene. FLJ20802 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ20802, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20802 BINDING SITE, designated SEQ ID:19674, to the nucleotide sequence of

VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9463] Another function of VGAM113 is therefore inhibition of FLJ20802 (Accession NM_017959). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20802. FLJ22169 (Accession NM_024085) is another VGAM113 host target gene. FLJ22169 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ22169, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ22169 BINDING SITE, designated SEQ ID:23523, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9464] Another function of VGAM113 is therefore inhibition of FLJ22169 (Accession NM_024085). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ22169. Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077) is another VGAM113 host target gene. GOLGA1 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by GOLGA1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GOLGA1 BINDING SITE, designated SEQ ID:7863, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9465] Another function of VGAM113 is therefore inhibition of Golgi Autoantigen, Golgin Subfamily A, 1 (GOLGA1, Accession NM_002077). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GOLGA1. KIAA0014 (Accession NM_014665) is another VGAM113 host target gene. KIAA0014 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0014, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0014 BINDING SITE, designated SEQ ID:16118, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9466] Another function of VGAM113 is therefore inhibition of KIAA0014 (Accession NM_014665). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0014. KIAA0494 (Accession NM_014774) is another VGAM113 host target gene. KIAA0494 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0494, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0494 BINDING SITE, designated SEQ ID:16593, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9467] Another function of VGAM113 is therefore inhibition of KIAA0494 (Accession NM_014774). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0494. MAP (Accession NM_022818) is another VGAM113 host target gene. MAP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MAP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MAP BINDING SITE, designated SEQ ID:23096, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9468] Another function of VGAM113 is therefore inhibition of MAP (Accession NM_022818). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MAP. NIR3 (Accession XM_038799) is another VGAM113 host target gene. NIR3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NIR3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NIR3 BINDING SITE, designated SEQ ID:32927, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9469] Another function of VGAM113 is therefore inhibition of NIR3 (Accession XM_038799). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NIR3. LOC160156 (Accession XM_090047) is another VGAM113

host target gene. LOC160156 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC160156, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC160156 BINDING SITE, designated SEQ ID:39992, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9470] Another function of VGAM113 is therefore inhibition of LOC160156 (Accession XM_090047). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC160156. LOC220477 (Accession XM_071675) is another VGAM113 host target gene. LOC220477 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC220477, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220477 BINDING SITE, designated SEQ ID:37408, to the nucleotide sequence of VGAM113 RNA, herein designated VGAM RNA, also designated SEQ ID:2824.

[9471] Another function of VGAM113 is therefore inhibition of LOC220477 (Accession XM_071675). Accordingly, utilities of VGAM113 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220477. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 114 (VGAM114) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9472] VGAM114 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM114 was detected is described hereinabove with reference to Figs. 1–8.

[9473] VGAM114 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9474] VGAM114 gene encodes a VGAM114 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM114

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM114 precursor RNA is designated SEQ ID:100, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:100 is located at position 41311 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9475] VGAM114 precursor RNA folds onto itself, forming VGAM114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9476] An enzyme complex designated DICER COMPLEX, `dices` the VGAM114 folded precursor RNA into VGAM114 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 45%) nucleotide sequence of VGAM114 RNA is designated SEQ ID:2825, and is provided hereinbelow with reference to the sequence listing part.

[9477] VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM114 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9478] VGAM114 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM114 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM114 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9479] The complementary binding of VGAM114 RNA, herein designated VGAM RNA, to host target binding sites on VGAM114 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM114 host target RNA into VGAM114 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9480] It is appreciated that VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM114 host target genes. The mRNA of

each one of this plurality of VGAM114 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM114 RNA, herein designated VGAM RNA, and which when bound by VGAM114 RNA causes inhibition of translation of respective one or more VGAM114 host target proteins.

[9481] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM114 gene, herein designated VGAM GENE, on one or more VGAM114 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[9482] It is yet further appreciated that a function of VGAM114 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM114 correlate with, and may be deduced from, the identity of the host target genes which VGAM114 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9483] Nucleotide sequences of the VGAM114 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM114 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM114 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM114 are further described hereinbelow with reference to Table 1.

[9484] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM114 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM114 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9485] As mentioned hereinabove with reference to Fig. 1, a function of VGAM114 gene, herein designated VGAM is inhibition of expression of VGAM114 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM114 correlate with, and may be deduced from, the identity of the target genes which VGAM114 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9486] Adenylate Cyclase 7 (ADCY7, Accession NM_001114) is a VGAM114 host target gene. ADCY7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ADCY7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ADCY7 BINDING SITE, designated SEQ ID:6783, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9487] A function of VGAM114 is therefore inhibition of Adenylate Cyclase 7 (ADCY7, Accession NM_001114), a gene

which this a membrane-bound, Ca^{2+} -inhibitable adenylyl cyclase. Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY7. The function of ADCY7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM108. Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM_000723) is another VGAM114 host target gene. CACNB1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CACNB1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CACNB1 BINDING SITE, designated SEQ ID:6385, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9488] Another function of VGAM114 is therefore inhibition of Calcium Channel, Voltage-dependent, Beta 1 Subunit (CACNB1, Accession NM_000723), a gene which may not only play an important role in the transport/insertion of the alpha-1S subunit into the membrane. Accordingly,

utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CACNB1. The function of CACNB1 has been established by previous studies. Pragnell et al. (1991) isolated a cDNA clone encoding a protein with high homology to the beta subunit of the rabbit skeletal muscle dihydropyridine-sensitive calcium channel from a rat brain cDNA library. This rat brain beta-subunit cDNA hybridized to a 3.4-kb message that was expressed in high levels in the cerebral hemispheres and hippocampus and much lower levels in cerebellum. The open reading frame encodes 597 amino acids with a predicted mass of 65,679 Da which is 82% homologous with the skeletal muscle beta subunit. The corresponding human beta-subunit gene was localized to chromosome 17 by analysis of somatic cell hybrids. Pragnell et al. (1991) suggested that the encoded brain beta subunit, which has a primary structure highly similar to its isoform in skeletal muscle, may have a comparable role as an integral regulatory component of a neuronal calcium channel. To determine the role of the beta-1 subunit in channel activity and excitation-contraction coupling, Gregg et al. (1996) used gene targeting to inactivate the beta-1 subunit in mice. Homozygous

mutant fetuses had a phenotype very similar to that seen in mice with mutations in either the alpha-1S subunit ('muscular dysgenic') or in the ryanodine receptor-1 (OMIM Ref. No. 180901), 'skrr.' All 3 mutants lacked excitation-contraction coupling. Beta-1-null mice died at birth from asphyxia. Electrical stimulation of beta-1-muscle failed to induce twitches; however, contractures were induced by caffeine. In isolated beta-1-null myotubes, action potentials were normal but failed to elicit calcium ion transient. Immunohistochemistry of cultured myotubes showed that not only was the beta-1 subunit absent, but the amount of alpha-1S in the membrane was also undetectable. In contrast, the beta-1 subunit was appropriately localized in alpha-1S-null cells. Therefore, Gregg et al. (1996) concluded that the beta-1 subunit may not only play an important role in the transport/insertion of the alpha-1S subunit into the membrane, but may also be vital for the targeting of the muscle dihydropyridine receptor complex to the transverse tubule/sarcoplasmic reticulum junction.

[9489] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [9490] Pragnell, M.; Sakamoto, J.; Jay, S. D.; Campbell, K. P. : Cloning and tissue-specific expression of the brain calcium channel beta-subunit. FEBS Lett. 291: 253-258, 1991. ; and
- [9491] Gregg, R. G.; Messing, A.; Strube, C.; Beurg, M.; Moss, R.; Behan, M.; Sukhareva, M.; Haynes, S.; Powell, J. A.; Coronado, R.; Powers, P. A. : Absence of the beta subunit (cchb1) of the.
- [9492] Further studies establishing the function and utilities of CACNB1 are found in John Hopkins OMIM database record ID 114207, and in cited publications numbered 4852-4853, 485 and 4854 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. DEC1 (Accession NM_017418) is another VGAM114 host target gene. DEC1 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DEC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DEC1 BINDING SITE, designated SEQ ID:18875, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9493] Another function of VGAM114 is therefore inhibition of DEC1 (Accession NM_017418), a gene which acts as a tumor suppressor associated with esophageal cancer. Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DEC1. The function of DEC1 has been established by previous studies. Loss of heterozygosity (LOH) is often shown at 9q31 in esophageal squamous cell carcinomas (OMIM Ref. No. 133239) as well as in squamous cell carcinomas of developmentally related tissues such as bladder (OMIM Ref. No. 109800), lung (OMIM Ref. No. 211980), and head and neck. Miura et al. (1996) delineated a region commonly deleted in esophageal squamous cell carcinomas to a 200-kb segment at 9q32. Nishiwaki et al. (2000) sequenced overlapping clones in this commonly deleted region and identified a possible candidate gene, which they named 'deleted in esophageal cancer-1' (DEC1). The DEC1 gene encodes a deduced 70-amino acid protein. Northern blot analysis detected a 1.4-kb DEC1 transcript in all tissues tested, with highest expression in prostate and testis. DEC1 expression was lower than normal and often absent in more than half of the esophageal carcinomas examined. Furthermore, DEC1

cDNA was able to exert growth suppressive activity in vitro. Although expression was reduced, no genetic alteration was detected in the DEC1 gene in any of the cancers examined.

[9494] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9495] Miura, K.; Suzuki, K.; Tokino, T.; Isomura, M.; Inazawa, J.; Matsuno, S.; Nakamura, Y. : Detailed deletion mapping in squamous cell carcinomas of the esophagus narrows a region containing a putative tumor suppressor gene to about 200 kilobases on distal chromosome 9q. *Cancer Res.* 56: 1629–1634, 1996. ; and

[9496] Nishiwaki, T.; Daigo, Y.; Kawasoe, T.; Nakamura, Y. : Isolation and mutational analysis of a novel human cDNA, DEC1 (deleted in esophageal cancer 1), derived from the tumor suppressor l.

[9497] Further studies establishing the function and utilities of DEC1 are found in John Hopkins OMIM database record ID 604767, and in cited publications numbered 7291–7292 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Hippocalcin (HPCA, Accession NM_002143) is another VGAM114 host target

gene. HPCA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HPCA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HPCA BINDING SITE, designated SEQ ID:7919, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9498] Another function of VGAM114 is therefore inhibition of Hippocalcin (HPCA, Accession NM_002143), a gene which may be an hippocampal calcium-binding protein. Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HPCA. The function of HPCA has been established by previous studies. Hippocalcin is a member of a family of neuron-specific $\text{Ca}(2+)$ -binding proteins found in the retina and brain. Hippocalcin is a 23-kD $\text{Ca}(2+)$ -binding protein first identified in the rat hippocampus (Kobayashi et al., 1992). The primary structure of rat hippocalcin comprises 193 amino acid residues and shows striking sequence similarities to proteins located in the photoreceptor cells that regulate photosignal transduction in a $\text{Ca}(2+)$ -sensitive manner. Hippocalcin is as-

sociated with the plasma membrane. Takamatsu et al. (1994) isolated a cDNA clone encoding human hippocalcin from a human hippocampus cDNA library. The human sequence showed 100% amino acid identity with the rat sequence and 92% nucleotide identity. Northern blot analysis detected a single 2.0-kb HPCA transcript only in brain.

[9499] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9500] Kobayashi, M.; Takamatsu, K.; Saitoh, S.; Miura, M.; Noguchi, T. : Molecular cloning of hippocalcin, a novel calcium-binding protein of the recoverin family exclusively expressed in hippocampus. *Biochem. Biophys. Res. Commun.* 189: 511-517, 1992. ; and

[9501] Takamatsu, K.; Kobayashi, M.; Saitoh, S.; Fujishiro, M.; Noguchi, T. : Molecular cloning of human hippocalcin cDNA and chromosomal mapping of its gene. *Biochem. Biophys. Res. Commun.* 20.

[9502] Further studies establishing the function and utilities of HPCA are found in John Hopkins OMIM database record ID 142622, and in cited publications numbered 3893-3894 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kell Blood Group

Precursor (McLeod phenotype) (XK, Accession NM_021083) is another VGAM114 host target gene. XK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XK BINDING SITE, designated SEQ ID:22057, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9503] Another function of VGAM114 is therefore inhibition of Kell Blood Group Precursor (McLeod phenotype) (XK, Accession NM_021083). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XK. DKFZp547I224 (Accession NM_020221) is another VGAM114 host target gene. DKFZp547I224 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by DKFZp547I224, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp547I224 BINDING SITE, designated SEQ ID:21480, to the nucleotide se-

quence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9504] Another function of VGAM114 is therefore inhibition of DKFZp547I224 (Accession NM_020221). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp547I224. DKFZP564D0478 (Accession NM_032125) is another VGAM114 host target gene. DKFZP564D0478 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564D0478, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564D0478 BINDING SITE, designated SEQ ID:25810, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9505] Another function of VGAM114 is therefore inhibition of DKFZP564D0478 (Accession NM_032125). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564D0478. FLJ12572 (Accession NM_022905) is another VGAM114 host target gene. FLJ12572 BINDING

SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ12572, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ12572 BINDING SITE, designated SEQ ID:23201, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9506] Another function of VGAM114 is therefore inhibition of FLJ12572 (Accession NM_022905). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ12572. Hypermethylated In Cancer 2 (HIC2, Accession XM_036937) is another VGAM114 host target gene. HIC2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HIC2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HIC2 BINDING SITE, designated SEQ ID:32525, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9507] Another function of VGAM114 is therefore inhibition of

Hypermethylated In Cancer 2 (HIC2, Accession XM_036937). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HIC2. HSA243666 (Accession NM_017582) is another VGAM114 host target gene. HSA243666 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HSA243666, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HSA243666 BINDING SITE, designated SEQ ID:19022, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9508] Another function of VGAM114 is therefore inhibition of HSA243666 (Accession NM_017582). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HSA243666. KIAA0296 (Accession NM_014699) is another VGAM114 host target gene. KIAA0296 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0296, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0296 BINDING SITE, designated SEQ ID:16218, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9509] Another function of VGAM114 is therefore inhibition of KIAA0296 (Accession NM_014699). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0296. LEAP-2 (Accession NM_052971) is another VGAM114 host target gene. LEAP-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LEAP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEAP-2 BINDING SITE, designated SEQ ID:27545, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9510] Another function of VGAM114 is therefore inhibition of LEAP-2 (Accession NM_052971). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEAP-2.

MGC10715 (Accession NM_024325) is another VGAM114 host target gene. MGC10715 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC10715, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC10715 BINDING SITE, designated SEQ ID:23613, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9511] Another function of VGAM114 is therefore inhibition of MGC10715 (Accession NM_024325). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC10715. SARM (Accession NM_015077) is another VGAM114 host target gene. SARM BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SARM, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SARM BINDING SITE, designated SEQ ID:17455, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also design-

nated SEQ ID:2825.

[9512] Another function of VGAM114 is therefore inhibition of SARM (Accession NM_015077). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SARM. LOC143287 (Accession XM_096410) is another VGAM114 host target gene. LOC143287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143287 BINDING SITE, designated SEQ ID:40344, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9513] Another function of VGAM114 is therefore inhibition of LOC143287 (Accession XM_096410). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC143287. LOC150967 (Accession XM_087060) is another VGAM114 host target gene. LOC150967 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150967, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150967 BINDING SITE, designated SEQ ID:39036, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9514] Another function of VGAM114 is therefore inhibition of LOC150967 (Accession XM_087060). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150967. LOC154877 (Accession XM_098626) is another VGAM114 host target gene. LOC154877 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC154877, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC154877 BINDING SITE, designated SEQ ID:41745, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9515] Another function of VGAM114 is therefore inhibition of LOC154877 (Accession XM_098626). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC154877. LOC165904 (Accession XM_093522) is another VGAM114 host target gene. LOC165904 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC165904, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC165904 BINDING SITE, designated SEQ ID:40193, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9516] Another function of VGAM114 is therefore inhibition of LOC165904 (Accession XM_093522). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC165904. LOC200325 (Accession XM_117223) is another VGAM114 host target gene. LOC200325 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC200325, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200325 BINDING SITE, designated SEQ ID:43288, to

the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9517] Another function of VGAM114 is therefore inhibition of LOC200325 (Accession XM_117223). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200325. LOC206463 (Accession XM_116523) is another VGAM114 host target gene. LOC206463 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC206463, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC206463 BINDING SITE, designated SEQ ID:43122, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9518] Another function of VGAM114 is therefore inhibition of LOC206463 (Accession XM_116523). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC206463. LOC220469 (Accession XM_084334) is another VGAM114 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC220469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:37555, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9519] Another function of VGAM114 is therefore inhibition of LOC220469 (Accession XM_084334). Accordingly, utilities of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. LOC245806 (Accession XM_166309) is another VGAM114 host target gene. LOC245806 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC245806, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245806 BINDING SITE, designated SEQ ID:44130, to the nucleotide sequence of VGAM114 RNA, herein designated VGAM RNA, also designated SEQ ID:2825.

[9520] Another function of VGAM114 is therefore inhibition of LOC245806 (Accession XM_166309). Accordingly, utilities

of VGAM114 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245806. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 115 (VGAM115) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9521] VGAM115 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM115 was detected is described hereinabove with reference to Figs. 1–8.

[9522] VGAM115 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9523] VGAM115 gene encodes a VGAM115 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM115 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide se–

quence of VGAM115 precursor RNA is designated SEQ ID:101, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:101 is located at position 125173 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9524] VGAM115 precursor RNA folds onto itself, forming VGAM115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9525] An enzyme complex designated DICER COMPLEX, `dices` the VGAM115 folded precursor RNA into VGAM115 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 82%) nucleotide se-

quence of VGAM115 RNA is designated SEQ ID:2826, and is provided hereinbelow with reference to the sequence listing part.

[9526] VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM115 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[9527] VGAM115 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM115 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is

meant as an illustration only, and is not meant to be limiting – VGAM115 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9528] The complementary binding of VGAM115 RNA, herein designated VGAM RNA, to host target binding sites on VGAM115 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM115 host target RNA into VGAM115 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9529] It is appreciated that VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM115 host target genes. The mRNA of each one of this plurality of VGAM115 host target genes comprises one or more host target binding sites, each

having a nucleotide sequence which is at least partly complementary to VGAM115 RNA, herein designated VGAM RNA, and which when bound by VGAM115 RNA causes inhibition of translation of respective one or more VGAM115 host target proteins.

[9530] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM115 gene, herein designated VGAM GENE, on one or more VGAM115 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9531] It is yet further appreciated that a function of VGAM115 is

inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM115 correlate with, and may be deduced from, the identity of the host target genes which VGAM115 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9532] Nucleotide sequences of the VGAM115 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM115 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM115 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM115 are further described hereinbelow with reference to Table 1.

[9533] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM115 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM115 RNA, herein designated VGAM RNA, are described hereinbelow with refer-

ence to Table 2.

[9534] As mentioned hereinabove with reference to Fig. 1, a function of VGAM115 gene, herein designated VGAM is inhibition of expression of VGAM115 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM115 correlate with, and may be deduced from, the identity of the target genes which VGAM115 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9535] General Transcription Factor II, I (GTF2I, Accession NM_032999) is a VGAM115 host target gene. GTF2I BINDING SITE1 and GTF2I BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by GTF2I, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GTF2I BINDING SITE1 and GTF2I BINDING SITE2, designated SEQ ID:26883 and SEQ ID:26887 respectively, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9536] A function of VGAM115 is therefore inhibition of General Transcription Factor II, I (GTF2I, Accession NM_032999), a

gene which interacts with the basal transcription machinery by coordinating the formation of a multiprotein complex at the c-fos promoter, and linking specific signal responsive activator complexes. Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GTF2I. The function of GTF2I has been established by previous studies. Through transfection experiments, Roy et al. (1997) found that GTF2I is capable of binding to both a pyrimidine-rich initiator (Inr) and an E-box for upstream stimulatory factor-1 (USF1; 191523). GTF2I and USF1 can also act synergistically to activate transcription through both Inr and the E-box elements of the adenovirus major late promoter. By in vitro cotranslation followed by coimmunoprecipitation studies, Roy et al. (1997) confirmed direct protein interaction between GTF2I and USF1.

Williams-Beuren syndrome (WBS; 194050) is a neurodevelopmental disorder with multisystemic manifestations caused by heterozygosity for a partial deletion of 7q11.23. The breakpoints cluster within regions located approximately 1 cM at either side of the elastin locus (ELN; 130160). Perez Jurado et al. (1998) characterized a duplicated region near the common deletion breakpoints,

which includes a transcribed gene. The centromeric (C) and telomeric (T) copies are almost identical in the duplicated 3-prime portions but diverge at the 5-prime ends. C-specific 4.3-kb mRNA and T-specific 5.4-kb mRNA are widely expressed in embryonic and adult tissues. The telomeric gene gives rise to several tandemly spliced forms and is deleted in all WBS individuals who have documented ELN deletions. Database searches showed that this gene encodes BAP135, a protein phosphorylated by BTK in B cells, as well as the multifunctional transcription factor TFII-I; hence, the gene name GTF2I. The centromeric gene is not deleted in WBS and appears to be a partially truncated expressed pseudogene (GTF2IP1) with no protein product. Both loci map to different genomic clone contigs that also contain other deleted and non-deleted loci. The duplicated region containing GTF2I and GTF2IP1, respectively, is located close to the deletion breakpoints and may predispose to unequal meiotic recombination between chromosome 7 homologs and/or to intrachromosomal rearrangements. Hemizyosity for GTF2I may also contribute to the WBS phenotype.

[9537] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [9538] Perez Jurado, L. A.; Wang, Y.-K.; Peoples, R.; Coloma, A.; Cruces, J.; Francke, U. : A duplicated gene in the break-point regions of the 7q11.23 Williams-Beuren syndrome deletion encodes the initiator binding protein TFII-I and BAP-135, a phosphorylation target of BTK. Hum. Molec. Genet. 7: 325-334, 1998. ; and
- [9539] Roy, A. L.; Du, H.; Gregor, P. D.; Novina, C. D.; Martinez, E.; Roeder, R. G. : Cloning of an Inr- and E-box binding protein, TFII-I, that interacts physically and functionally with USF1.
- [9540] Further studies establishing the function and utilities of GTF2I are found in John Hopkins OMIM database record ID 601679, and in cited publications numbered 619 and 12616 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM_003053) is another VGAM115 host target gene. SLC18A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC18A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of SLC18A1 BINDING SITE, designated SEQ ID:9017, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9541] Another function of VGAM115 is therefore inhibition of Solute Carrier Family 18 (vesicular monoamine), Member 1 (SLC18A1, Accession NM_003053), a gene which is involved in the vesicular transport of biogenic amines. Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC18A1. The function of SLC18A1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM18.FLJ23563 (Accession XM_041701) is another VGAM115 host target gene. FLJ23563 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ23563, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ23563 BINDING SITE, designated SEQ ID:33560, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ

ID:2826.

[9542] Another function of VGAM115 is therefore inhibition of FLJ23563 (Accession XM_041701). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ23563. KIAA0408 (Accession NM_014702) is another VGAM115 host target gene. KIAA0408 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA0408, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0408 BINDING SITE, designated SEQ ID:16232, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9543] Another function of VGAM115 is therefore inhibition of KIAA0408 (Accession NM_014702). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0408. KIAA0527 (Accession XM_171054) is another VGAM115 host target gene. KIAA0527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0527, corresponding to

a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0527 BINDING SITE, designated SEQ ID:45844, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9544] Another function of VGAM115 is therefore inhibition of KIAA0527 (Accession XM_171054). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0527. KIAA1535 (Accession XM_086565) is another VGAM115 host target gene. KIAA1535 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1535, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1535 BINDING SITE, designated SEQ ID:38765, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9545] Another function of VGAM115 is therefore inhibition of KIAA1535 (Accession XM_086565). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1535. MGC13007 (Accession NM_032320) is another VGAM115 host target gene. MGC13007 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by MGC13007, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13007 BINDING SITE, designated SEQ ID:26120, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9546] Another function of VGAM115 is therefore inhibition of MGC13007 (Accession NM_032320). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13007. RNA Binding Motif Protein 14 (RBM14, Accession NM_006328) is another VGAM115 host target gene. RBM14 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RBM14, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RBM14 BINDING SITE, designated SEQ

ID:13020, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9547] Another function of VGAM115 is therefore inhibition of RNA Binding Motif Protein 14 (RBM14, Accession NM_006328). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RBM14. LOC147343 (Accession XM_097225) is another VGAM115 host target gene. LOC147343 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC147343, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147343 BINDING SITE, designated SEQ ID:40831, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9548] Another function of VGAM115 is therefore inhibition of LOC147343 (Accession XM_097225). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147343. LOC149301 (Accession XM_086480) is an-

other VGAM115 host target gene. LOC149301 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC149301, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149301 BINDING SITE, designated SEQ ID:38690, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9549] Another function of VGAM115 is therefore inhibition of LOC149301 (Accession XM_086480). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149301. LOC257319 (Accession XM_171049) is another VGAM115 host target gene. LOC257319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257319 BINDING SITE, designated SEQ ID:45831, to the nucleotide sequence of VGAM115 RNA, herein designated VGAM RNA, also designated SEQ ID:2826.

[9550] Another function of VGAM115 is therefore inhibition of LOC257319 (Accession XM_171049). Accordingly, utilities of VGAM115 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257319. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 116 (VGAM116) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9551] VGAM116 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM116 was detected is described hereinabove with reference to Figs. 1–8.

[9552] VGAM116 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9553] VGAM116 gene encodes a VGAM116 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM116

precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM116 precursor RNA is designated SEQ ID:102, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:102 is located at position 284651 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9554] VGAM116 precursor RNA folds onto itself, forming VGAM116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9555] An enzyme complex designated DICER COMPLEX, `dices` the VGAM116 folded precursor RNA into VGAM116 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex

comprising an enzyme called Dicer together with other necessary proteins. A probable (over 42%) nucleotide sequence of VGAM116 RNA is designated SEQ ID:2827, and is provided hereinbelow with reference to the sequence listing part.

[9556] VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM116 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[9557] VGAM116 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM116 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and

BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM116 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9558] The complementary binding of VGAM116 RNA, herein designated VGAM RNA, to host target binding sites on VGAM116 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM116 host target RNA into VGAM116 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9559] It is appreciated that VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM116 host target genes. The mRNA of

each one of this plurality of VGAM116 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM116 RNA, herein designated VGAM RNA, and which when bound by VGAM116 RNA causes inhibition of translation of respective one or more VGAM116 host target proteins.

[9560] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM116 gene, herein designated VGAM GENE, on one or more VGAM116 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science

294,779 (2001)).

[9561] It is yet further appreciated that a function of VGAM116 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM116 correlate with, and may be deduced from, the identity of the host target genes which VGAM116 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9562] Nucleotide sequences of the VGAM116 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM116 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM116 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM116 are further described hereinbelow with reference to Table 1.

[9563] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM116 host target RNA, and schematic representation of the complementarity of each of these

host target binding sites to VGAM116 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9564] As mentioned hereinabove with reference to Fig. 1, a function of VGAM116 gene, herein designated VGAM is inhibition of expression of VGAM116 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM116 correlate with, and may be deduced from, the identity of the target genes which VGAM116 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9565] Calnexin (CANX, Accession XM_113469) is a VGAM116 host target gene. CANX BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CANX, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CANX BINDING SITE, designated SEQ ID:42278, to the nucleotide sequence of VGAM116 RNA, herein designated VGAM RNA, also designated SEQ ID:2827.

[9566] A function of VGAM116 is therefore inhibition of Calnexin (CANX, Accession XM_113469), a gene which may func-

tion as a chaperone in the endoplasmic reticulum, involved in the secretion of proteins from the ER to the outer cellular membrane. Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CANX. The function of CANX has been established by previous studies. Calnexin is a 90-kilodalton integral membrane protein of the endoplasmic reticulum (ER). It exhibits high affinity for the binding of calcium ions, which was the means by which it was first identified. Calcium ions are known to play a central role in the regulation of cellular metabolism, including signal transduction events and the transport of proteins through the ER. Calnexin has been shown to be associated with several cell surface proteins during translocation through the ER and has been isolated as a complex with other ER proteins involved in calcium ion-dependent retention of proteins. It may function as a chaperone to regulate the transit of proteins through the ER. Tjoelker et al. (1994) isolated cDNA clones of the human, mouse, and rat calnexins. Comparisons of the sequences demonstrated a high level of conservation of sequence identity, suggesting that calnexin performs important cellular functions. Schwann cell-derived peripheral

myelin protein-22 (PMP22; 601097), when mutated or overexpressed, causes heritable neuropathies with a 'gain-of-function' endoplasmic reticulum (ER) phenotype.

PMP22 associates in a specific and transient manner with CANX in wildtype sciatic nerves. In the sciatic nerves of the Trembler (TrJ) mouse carrying the same mutation in the PMP22 gene that causes Charcot-Marie-Tooth disease (CMT) in the human, Dickson et al. (2002) found prolonged association of mutant PMP22 with CANX. In cultured cells expressing the TrJ mutant PMP22, CANX and PMP22 colocalized in large intracellular structures identified at the electron microscopy level as myelin-like figures, with CANX localization in the structures dependent on PMP22 glucosylation. Similar intracellular myelin-like figures were also present in Schwann cells of sciatic nerves from homozygous TrJ mice. Sequestration of CANX in intracellular myelin-like figures may be relevant to the pathogenesis of autosomal dominant CMT-related neuropathies.

[9567] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

Association of calnexin with mutant peripheral myelin
protein–22 ex v.

[9570] Further studies establishing the function and utilities of
CANX are found in John Hopkins OMIM database record ID
114217, and in cited publications numbered 4032–4035
listed in the bibliography section hereinbelow, which are
also hereby incorporated by reference. DKFZP564C196
(Accession XM_046405) is another VGAM116 host target
gene. DKFZP564C196 BINDING SITE is HOST TARGET
binding site found in the 3` untranslated region of mRNA
encoded by DKFZP564C196, corresponding to a HOST
TARGET binding site such as BINDING SITE I, BINDING SITE
II or BINDING SITE III. Table 2 illustrates the complemen-
tarity of the nucleotide sequences of DKFZP564C196
BINDING SITE, designated SEQ ID:34714, to the nucleotide
sequence of VGAM116 RNA, herein designated VGAM

RNA, also designated SEQ ID:2827.

- [9571] Another function of VGAM116 is therefore inhibition of DKFZP564C196 (Accession XM_046405). Accordingly, utilities of VGAM116 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564C196. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 117 (VGAM117) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.
- [9572] VGAM117 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM117 was detected is described hereinabove with reference to Figs. 1–8.
- [9573] VGAM117 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.
- [9574] VGAM117 gene encodes a VGAM117 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other

miRNA genes, and unlike most ordinary genes, VGAM117 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM117 precursor RNA is designated SEQ ID:103, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:103 is located at position 80462 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9575] VGAM117 precursor RNA folds onto itself, forming VGAM117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9576] An enzyme complex designated DICER COMPLEX, `dices` the VGAM117 folded precursor RNA into VGAM117 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short

~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM117 RNA is designated SEQ ID:2828, and is provided hereinbelow with reference to the sequence listing part.

[9577] VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM117 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[9578] VGAM117 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM117 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding

sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM117 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9579] The complementary binding of VGAM117 RNA, herein designated VGAM RNA, to host target binding sites on VGAM117 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM117 host target RNA into VGAM117 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9580] It is appreciated that VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents

a plurality of VGAM117 host target genes. The mRNA of each one of this plurality of VGAM117 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM117 RNA, herein designated VGAM RNA, and which when bound by VGAM117 RNA causes inhibition of translation of respective one or more VGAM117 host target proteins.

[9581] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM117 gene, herein designated VGAM GENE, on one or more VGAM117 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G.,

`Perspective: Glimpses of a tiny RNA world`, Science
294,779 (2001)).

[9582] It is yet further appreciated that a function of VGAM117 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM117 correlate with, and may be deduced from, the identity of the host target genes which VGAM117 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9583] Nucleotide sequences of the VGAM117 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM117 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM117 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM117 are further described hereinbelow with reference to Table 1.

[9584] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM117 host target RNA, and schematic

representation of the complementarity of each of these host target binding sites to VGAM117 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9585] As mentioned hereinabove with reference to Fig. 1, a function of VGAM117 gene, herein designated VGAM is inhibition of expression of VGAM117 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM117 correlate with, and may be deduced from, the identity of the target genes which VGAM117 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9586] Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206) is a VGAM117 host target gene. PDGFRA BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRA BINDING SITE, designated SEQ ID:12879, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:2828.

[9587] A function of VGAM117 is therefore inhibition of Platelet-derived Growth Factor Receptor, Alpha Polypeptide (PDGFRA, Accession NM_006206), a gene which this receptor binds platelet-derived growth factor and has a tyrosine-protein kinase activity. Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRA. The function of PDGFRA has been established by previous studies. Considerable insight into the role of the sonic hedgehog (OMIM Ref. No. 600725) pathway in vertebrate development and human cancers came from the discovery that mutations in `patched` (PTCH; 601309) are associated with basal cell nevus syndrome (BCNS; 109400), an autosomal dominant disorder combining developmental anomalies and tumors, particularly basal cell carcinomas (BCCs). Sporadic BCCs, the most common human cancer, consistently have abnormalities in the hedgehog pathway, and often mutations in PTCH. In addition, somatic mutations in `smoothened` (SMOH; 601500), another protein in the hedgehog pathway, occur in sporadic BCCs. The downstream molecule GLI1 (OMIM Ref. No. 165220) is known to mediate the biologic effect of the hedgehog pathway and is itself upregulated in all BCCs. Gli1 can

drive the production of BCCs in the mouse when overexpressed in the epidermis. Xie et al. (2001) showed that GLI1 can activate PDGFR-alpha and that functional upregulation of PDGFR-alpha by GLI1 is accompanied by activation of the Ras-ERK pathway, which is associated with cell proliferation. The relevance of this mechanism in vivo is supported by a high level of expression of PDGFR-alpha in BCCs in mice and humans. From these and other observations, Xie et al. (2001) concluded that increased expression of the PDGFR-alpha gene may be an important mechanism by which mutations in the hedgehog pathway cause BCCs. Animal model experiments lend further support to the function of PDGFRA. Klinghoffer et al. (2001) created 2 complementary lines of knockin mice in which the intracellular signaling domains of one PDGFR had been removed and replaced by those of the other PDGFR. While both lines demonstrated substantial rescue of normal development, substitution of the *Pdgfrb* signaling domains with those of *Pdgfra* resulted in varying degrees of vascular disease.

[9588] It is appreciated that the abovementioned animal model for PDGFRA is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further ap-

preciated from the publications sited hereinbelow.

[9589] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9590] Xie, J.; Aszterbaum, M.; Zhang, X.; Bonifas, J. M.; Zachary, C.; Epstein, E.; McCormick, F. : A role of PDGFR-alpha in basal cell carcinoma proliferation. Proc. Nat. Acad. Sci. 98: 9255-9259, 2001. ; and

[9591] Klinghoffer, R. A.; Muetting-Nelsen, P. F.; Faerman, A.; Shani, M.; Soriano, P. : The two PDGF receptors maintain conserved signaling in vivo despite divergent embryological functions.

[9592] Further studies establishing the function and utilities of PDGFRA are found in John Hopkins OMIM database record ID 173490, and in sited publications numbered 12457-12458, 10725, 12459-12462, 12641, 353 and 3535-1207 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. KIAA0222 (Accession NM_014643) is another VGAM117 host target gene. KIAA0222 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0222, corresponding to a HOST TARGET binding site such as BINDING SITE I,

BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0222 BINDING SITE, designated SEQ ID:16047, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:2828.

[9593] Another function of VGAM117 is therefore inhibition of KIAA0222 (Accession NM_014643). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0222. PRO1600 (Accession NM_014095) is another VGAM117 host target gene. PRO1600 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by PRO1600, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1600 BINDING SITE, designated SEQ ID:15315, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:2828.

[9594] Another function of VGAM117 is therefore inhibition of PRO1600 (Accession NM_014095). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1600.

TEB4 (Accession XM_027156) is another VGAM117 host target gene. TEB4 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TEB4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEB4 BINDING SITE, designated SEQ ID:30429, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:2828.

[9595] Another function of VGAM117 is therefore inhibition of TEB4 (Accession XM_027156). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEB4. LOC125268 (Accession XM_071960) is another VGAM117 host target gene. LOC125268 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC125268, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC125268 BINDING SITE, designated SEQ ID:37452, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA,

also designated SEQ ID:2828.

[9596] Another function of VGAM117 is therefore inhibition of LOC125268 (Accession XM_071960). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC125268. LOC220469 (Accession XM_084334) is another VGAM117 host target gene. LOC220469 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220469, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220469 BINDING SITE, designated SEQ ID:37556, to the nucleotide sequence of VGAM117 RNA, herein designated VGAM RNA, also designated SEQ ID:2828.

[9597] Another function of VGAM117 is therefore inhibition of LOC220469 (Accession XM_084334). Accordingly, utilities of VGAM117 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220469. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 118 (VGAM118) viral gene, which modu-

lates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9598] VGAM118 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM118 was detected is described hereinabove with reference to Figs. 1–8.

[9599] VGAM118 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9600] VGAM118 gene encodes a VGAM118 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM118 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM118 precursor RNA is designated SEQ ID:104, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:104 is located at position 178358 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9601] VGAM118 precursor RNA folds onto itself, forming VGAM118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9602] An enzyme complex designated DICER COMPLEX, `dices` the VGAM118 folded precursor RNA into VGAM118 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 46%) nucleotide sequence of VGAM118 RNA is designated SEQ ID:2829, and is provided hereinbelow with reference to the sequence listing part.

[9603] VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM118 host target RNA, herein designated VGAM

HOST TARGET RNA. VGAM118 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9604] VGAM118 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM118 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM118 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding

sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9605] The complementary binding of VGAM118 RNA, herein designated VGAM RNA, to host target binding sites on VGAM118 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM118 host target RNA into VGAM118 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9606] It is appreciated that VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM118 host target genes. The mRNA of each one of this plurality of VGAM118 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM118 RNA, herein designated VGAM RNA, and which when bound by VGAM118 RNA causes inhibition of translation of respective one or more VGAM118 host target proteins.

[9607] It is further appreciated by one skilled in the art that the

mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM118 gene, herein designated VGAM GENE, on one or more VGAM118 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9608] It is yet further appreciated that a function of VGAM118 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM118 correlate

with, and may be deduced from, the identity of the host target genes which VGAM118 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9609] Nucleotide sequences of the VGAM118 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM118 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM118 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM118 are further described hereinbelow with reference to Table 1.

[9610] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM118 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM118 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9611] As mentioned hereinabove with reference to Fig. 1, a function of VGAM118 gene, herein designated VGAM is inhibition of expression of VGAM118 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM118 correlate with, and may be deduced

from, the identity of the target genes which VGAM118 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9612] Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199) is a VGAM118 host target gene. EIF2C1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EIF2C1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EIF2C1 BINDING SITE, designated SEQ ID:14507, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9613] A function of VGAM118 is therefore inhibition of Eukaryotic Translation Initiation Factor 2C, 1 (EIF2C1, Accession NM_012199), a gene which plays an important role in the eukaryotic peptide chain initiation process. Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EIF2C1. The function of EIF2C1 has been established by previous studies. Koesters et al. (1999) isolated a EIF2C1 cDNA from a human fetal kidney cDNA library. To

obtain genomic sequence information, they isolated a P1 genomic clone containing the EIF2C1 locus. The human EIF2C1 gene encodes a protein of 857 amino acids. The 2,571-bp open reading frame is flanked by 238 bp of 5-prime sequence and an extremely large 3-prime untranslated region with multiple short repeated segments composed of mono-, tri-, or quatrunucleotides interspersed throughout. Northern blot analysis demonstrated that the human EIF2C1 gene is ubiquitously expressed at low to medium levels. Differential polyadenylation and splicing resulted in a complex transcriptional pattern. Martinez et al. (2002) demonstrated that a single-stranded small interfering RNA (siRNA) resides in the human RNA-induced silencing complex (RISC) together with the EIF2C1 and/or EIF2C2 (OMIM Ref. No. 606229) proteins. RISC could be rapidly formed in HeLa cell cytoplasmic extract supplemented with 21-nucleotide siRNA duplexes, but also by adding single-stranded antisense RNAs, which range in size between 19 and 29 nucleotides.

[9614] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9615] Koesters, R.; Adams, V.; Betts, D.; Moos, R.; Schmid, M.;

Siermann, A.; Hassam, S.; Weitz, S.; Lichter, P.; Heitz, P. U.; von Knebel Doeberitz, M.; Briner, J. : Human eukaryotic initiation factor EIF2C1 gene: cDNA sequence, genomic organization, localization to chromosomal bands 1q34–p35, and expression. Genomics 61: 210–218, 1999. ; and

[9616] Martinez, J.; Patkaniowska, A.; Urlaub, H.; Luhrmann, R.; Tusch, T. : Single-stranded antisense siRNAs guide target RNA cleavage in RNAi. Cell 110: 563–574, 2002.

[9617] Further studies establishing the function and utilities of EIF2C1 are found in John Hopkins OMIM database record ID 606228, and in cited publications numbered 6591–6592 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_000458) is another VGAM118 host target gene. TCF2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TCF2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TCF2 BINDING SITE, designated SEQ ID:6075, to the nucleotide se-

quence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9618] Another function of VGAM118 is therefore inhibition of Transcription Factor 2, Hepatic; LF-B3; Variant Hepatic Nuclear Factor (TCF2, Accession NM_000458), a gene which probably binds to the inverted palindrome 5'-gttaatnattaac-3'. Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TCF2. The function of TCF2 has been established by previous studies. Abbott et al. (1990) isolated and partially sequenced a human clone corresponding to the gene for liver-specific transcription factor LFB3. Furthermore, they designed oligonucleotide primers for TCF2 (also called HNF1B) and used them to amplify specifically the human gene in human/rodent somatic cell hybrids by the polymerase chain reaction. They showed that TCF2 maps to 17q between the centromere and the breakpoint of acute promyelocytic leukemia, i.e., proximal to 17q22. Hepatocyte nuclear factor-1 (HNF1A, or TCF1; 142410) is a homeodomain-containing transcriptional activator required for the liver-specific expression of a variety of genes. Bach et al. (1991) isolated a cDNA clone from a human liver library encoding a protein,

designated HNF1B, that is highly homologous to HNF1A (also called TCF1) in 3 regions, including the homeo domain and the dimerization domain. They showed that this protein can heterodimerize with human HNF1A in vitro. Sequence comparison with a rat variant HNF1A identified the cDNA as the human homolog. HNF1B is a nuclear protein recognizing the same binding site as HNF1A. By Northern blot analysis, Bach et al. (1991) showed that the HNF1B transcripts are present in differentiated human HepG2 hepatoma cells as well as in rat liver and that this transcript level is 10- to 20-fold lower than that of HNF1A. They assigned the HNF1B gene to human chromosome 17 and mouse chromosome 11. The HNF1A gene maps to human chromosome 12 and mouse chromosome 5.

[9619] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9620] Abbott, C.; Piaggio, G.; Ammendola, R.; Solomon, E.; Povey, S.; Gounari, F.; De Simone, V.; Cortese, R. : Mapping of the gene TCF2 for the transcription factor LFB3 to human chromosome 17 by polymerase chain reaction. Genomics 8: 165-167, 1990. ; and

- [9621] Bach, I.; Mattei, M.-G.; Cereghini, S.; Yaniv, M. : Two members of an HNF1 homeoprotein family are expressed in human liver. *Nucleic Acids Res.* 19: 3553–3559, 1991.
- [9622] Further studies establishing the function and utilities of TCF2 are found in John Hopkins OMIM database record ID 189907, and in cited publications numbered 12603–12604, 2181, 12605–12606, 2182, 2529, 12607–12608, 218 and 12609 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cyclin M4 (CNNM4, Accession NM_020184) is another VGAM118 host target gene. CNNM4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CNNM4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CNNM4 BINDING SITE, designated SEQ ID:21425, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.
- [9623] Another function of VGAM118 is therefore inhibition of Cyclin M4 (CNNM4, Accession NM_020184). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated

with CNM4. Histamine Receptor H4 (HRH4, Accession NM_021624) is another VGAM118 host target gene. HRH4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HRH4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HRH4 BINDING SITE, designated SEQ ID:22261, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9624] Another function of VGAM118 is therefore inhibition of Histamine Receptor H4 (HRH4, Accession NM_021624). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HRH4. KIAA1449 (Accession NM_020839) is another VGAM118 host target gene. KIAA1449 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1449, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1449 BINDING SITE, designated SEQ ID:21897, to the nucleotide sequence of VGAM118 RNA, herein designated

VGAM RNA, also designated SEQ ID:2829.

[9625] Another function of VGAM118 is therefore inhibition of KIAA1449 (Accession NM_020839). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1449. KIAA1981 (Accession XM_114000) is another VGAM118 host target gene. KIAA1981 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1981, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1981 BINDING SITE, designated SEQ ID:42609, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9626] Another function of VGAM118 is therefore inhibition of KIAA1981 (Accession XM_114000). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1981. Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM_014899) is another VGAM118 host target gene. RHOBTB3 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA

encoded by RHOBTB3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RHOBTB3 BINDING SITE, designated SEQ ID:17078, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9627] Another function of VGAM118 is therefore inhibition of Rho-related BTB Domain Containing 3 (RHOBTB3, Accession NM_014899). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RHOBTB3. LOC149076 (Accession XM_086415) is another VGAM118 host target gene. LOC149076 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149076, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149076 BINDING SITE, designated SEQ ID:38639, to the nucleotide sequence of VGAM118 RNA, herein designated VGAM RNA, also designated SEQ ID:2829.

[9628] Another function of VGAM118 is therefore inhibition of

LOC149076 (Accession XM_086415). Accordingly, utilities of VGAM118 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149076. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 119 (VGAM119) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9629] VGAM119 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM119 was detected is described hereinabove with reference to Figs. 1–8.

[9630] VGAM119 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9631] VGAM119 gene encodes a VGAM119 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM119 precursor RNA does not encode a protein. A nucleotide

sequence identical or highly similar to the nucleotide sequence of VGAM119 precursor RNA is designated SEQ ID:105, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:105 is located at position 278814 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9632] VGAM119 precursor RNA folds onto itself, forming VGAM119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9633] An enzyme complex designated DICER COMPLEX, `dices` the VGAM119 folded precursor RNA into VGAM119 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other

necessary proteins. A probable (over 41%) nucleotide sequence of VGAM119 RNA is designated SEQ ID:2830, and is provided hereinbelow with reference to the sequence listing part.

[9634] VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM119 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5'UTR, PROTEIN CODING and 3'UTR respectively.

[9635] VGAM119 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM119 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the

number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM119 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9636] The complementary binding of VGAM119 RNA, herein designated VGAM RNA, to host target binding sites on VGAM119 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM119 host target RNA into VGAM119 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9637] It is appreciated that VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM119 host target genes. The mRNA of each one of this plurality of VGAM119 host target genes

comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM119 RNA, herein designated VGAM RNA, and which when bound by VGAM119 RNA causes inhibition of translation of respective one or more VGAM119 host target proteins.

[9638] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM119 gene, herein designated VGAM GENE, on one or more VGAM119 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9639] It is yet further appreciated that a function of VGAM119 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM119 correlate with, and may be deduced from, the identity of the host target genes which VGAM119 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9640] Nucleotide sequences of the VGAM119 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM119 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM119 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM119 are further described hereinbelow with reference to Table 1.

[9641] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM119 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM119 RNA, herein desig-

nated VGAM RNA, are described hereinbelow with reference to Table 2.

[9642] As mentioned hereinabove with reference to Fig. 1, a function of VGAM119 gene, herein designated VGAM is inhibition of expression of VGAM119 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM119 correlate with, and may be deduced from, the identity of the target genes which VGAM119 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9643] Phospholamban (PLN, Accession NM_002667) is a VGAM119 host target gene. PLN BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLN BINDING SITE, designated SEQ ID:8538, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9644] A function of VGAM119 is therefore inhibition of Phospholamban (PLN, Accession NM_002667), a gene which regulates the activity of the calcium pump of cardiac sar-

coplasmic reticulum. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLN. The function of PLN has been established by previous studies. Fujii et al. (1991) isolated and characterized genomic DNA clones encoding rabbit phospholamban. The phospholamban gene of 13.2 kb contained only one 10.5-kb intron which separated exonic sequences located in the 5-prime untranslated region. Phospholamban, through modulation of sarcoplasmic reticulum calcium-ATPase activity, is a key regulator of cardiac diastolic function. Alterations in phospholamban expression may define parameters of muscle relaxation. McTiernan et al. (1999) observed that human ventricle and quadriceps displayed high levels of phospholamban transcripts and proteins, with markedly lower expression observed in smooth muscles, while the right atrium also expressed low levels of phospholamban. The structure of the human phospholamban gene closely resembles that reported for chicken, rabbit, rat, and mouse. Comparison of the human to other mammalian phospholamban genes indicated a marked conservation of sequence for at least 217 bp upstream of the transcription start site.

- [9645] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9646] Fujii, J.; Zarain-Herzberg, A.; Willard, H. F.; Tada, M.; MacLennan, D. H. : Structure of the rabbit phospholamban gene, cloning of the human cDNA, and assignment of the gene to human chromosome 6. J. Biol. Chem. 266: 11669–11675, 1991. ; and
- [9647] McTiernan, C. F.; Frye, C. S.; Lemster, B. H.; Kinder, E. A.; Ogletree-Hughes, M. L.; Moravec, C. S.; Feldman, A. M. : The human phospholamban gene: structure and expression. J. Molec. Cell.
- [9648] Further studies establishing the function and utilities of PLN are found in John Hopkins OMIM database record ID 172405, and in cited publications numbered 10832–10834 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805) is another VGAM119 host target gene. SMT3H1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMT3H1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMT3H1 BINDING SITE, designated SEQ ID:30125, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9649] Another function of VGAM119 is therefore inhibition of SMT3 Suppressor of Mif Two 3 Homolog 1 (yeast) (SMT3H1, Accession XM_009805), a gene which is involved in the function and/or structure of the eukaryotic kinetochore. Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMT3H1. The function of SMT3H1 has been established by previous studies. TEXT Lapenta et al. (1997) used cDNA selection to isolate coding sequences from cosmids mapping to the gene-rich telomeric region of human chromosome 21q. A cDNA, which the authors termed SMT3A, was isolated and mapped between the loci PFKL and D21S171 on 21q22.3, about 2.2 Mb proximal to the telomere. The predicted protein of 103 amino acids was found to be a homolog of the *S. cerevisiae* SMT3 protein, whose gene was previously isolated as a suppressor of mutations in the MIF2 gene (Meluh and Koshland, 1995). The yeast MIF2 gene en-

codes an essential centromeric protein and shows homology to mammalian CENPC (see OMIM Ref. No. 117141), an integral component of active kinetochores (Meluh and Koshland, 1995). The proposed role of yeast SMT3 as a centromeric protein and the strong evolutionary conservation of the human SMT3A gene suggested to Lapenta et al. (1997) that the encoded protein is involved in the function and/or structure of the eukaryotic kinetochore. SMT3A is also highly homologous to ubiquitin (OMIM Ref. No. 191320). Lapenta et al. (1997) identified 2 additional human SMT3-like sequences, named SMT3B (OMIM Ref. No. 603042) and SMT3C (OMIM Ref. No. 601912), as expressed sequence tags; SMT3A shares 87% amino acid identity with SMT3B and 47% identity with SMT3C.

[9650] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9651] Lapenta, V.; Chiurazzi, P.; van der Spek, P.; Pizzuti, A.; Hanaoka, F.; Brahe, C. : SMT3A, a human homologue of the *S. cerevisiae* SMT3 gene, maps to chromosome 21qter and defines a novel gene family. *Genomics* 40: 362–366, 1997. ; and

[9653] Further studies establishing the function and utilities of SMT3H1 are found in John Hopkins OMIM database record ID 602231, and in cited publications numbered 9136–6288 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. EZFIT (Accession NM_021216) is another VGAM119 host target gene. EZFIT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EZFIT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EZFIT BINDING SITE, designated SEQ ID:22195, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9654] Another function of VGAM119 is therefore inhibition of EZFIT (Accession NM_021216). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EZFIT. FLJ13110 (Accession NM_022912) is another VGAM119 host target gene. FLJ13110 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA

encoded by FLJ13110, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13110 BINDING SITE, designated SEQ ID:23223, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9655] Another function of VGAM119 is therefore inhibition of FLJ13110 (Accession NM_022912). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13110. KIAA0429 (Accession NM_014751) is another VGAM119 host target gene. KIAA0429 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0429, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0429 BINDING SITE, designated SEQ ID:16475, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9656] Another function of VGAM119 is therefore inhibition of KIAA0429 (Accession NM_014751). Accordingly, utilities

of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0429. KIAA0662 (Accession XM_088539) is another VGAM119 host target gene. KIAA0662 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0662, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0662 BINDING SITE, designated SEQ ID:39802, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9657] Another function of VGAM119 is therefore inhibition of KIAA0662 (Accession XM_088539). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0662. KIAA1371 (Accession XM_114371) is another VGAM119 host target gene. KIAA1371 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1371, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA1371 BINDING SITE, designated SEQ ID:42907, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9658] Another function of VGAM119 is therefore inhibition of KIAA1371 (Accession XM_114371). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1371. KIAA1508 (Accession XM_030209) is another VGAM119 host target gene. KIAA1508 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by KIAA1508, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1508 BINDING SITE, designated SEQ ID:30993, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9659] Another function of VGAM119 is therefore inhibition of KIAA1508 (Accession XM_030209). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1508. moblak (Accession NM_130807) is another VGAM119 host target gene. moblak BINDING SITE is HOST

TARGET binding site found in the 5` untranslated region of mRNA encoded by moblak, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of moblak BINDING SITE, designated SEQ ID:28310, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9660] Another function of VGAM119 is therefore inhibition of moblak (Accession NM_130807). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with moblak. RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM_032144) is another VGAM119 host target gene. RAB6C BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by RAB6C, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB6C BINDING SITE, designated SEQ ID:25836, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9661] Another function of VGAM119 is therefore inhibition of RAB6C, Member RAS Oncogene Family (RAB6C, Accession NM_032144). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB6C. LOC219899 (Accession XM_166173) is another VGAM119 host target gene. LOC219899 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC219899, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC219899 BINDING SITE, designated SEQ ID:43990, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9662] Another function of VGAM119 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. LOC221773 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221773, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221773 BINDING SITE, designated SEQ ID:43762, to the nucleotide sequence of VGAM119 RNA, herein designated VGAM RNA, also designated SEQ ID:2830.

[9663] Another function of VGAM119 is therefore inhibition of LOC221773 (Accession XM_165802). Accordingly, utilities of VGAM119 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221773. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 120 (VGAM120) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9664] VGAM120 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM120 was detected is described hereinabove with reference to Figs. 1–8.

[9665] VGAM120 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syn–

drome Virus (white spot bacilliform virus). VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9666] VGAM120 gene encodes a VGAM120 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM120 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM120 precursor RNA is designated SEQ ID:106, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:106 is located at position 277493 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9667] VGAM120 precursor RNA folds onto itself, forming VGAM120 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9668] An enzyme complex designated DICER COMPLEX, `dices` the VGAM120 folded precursor RNA into VGAM120 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM120 RNA is designated SEQ ID:2831, and is provided hereinbelow with reference to the sequence listing part.

[9669] VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM120 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9670] VGAM120 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM120 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM120 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9671] The complementary binding of VGAM120 RNA, herein designated VGAM RNA, to host target binding sites on VGAM120 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM120 host tar–

get RNA into VGAM120 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9672] It is appreciated that VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM120 host target genes. The mRNA of each one of this plurality of VGAM120 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM120 RNA, herein designated VGAM RNA, and which when bound by VGAM120 RNA causes inhibition of translation of respective one or more VGAM120 host target proteins.

[9673] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM120 gene, herein designated VGAM GENE, on one or more VGAM120 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9674] It is yet further appreciated that a function of VGAM120 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM120 correlate with, and may be deduced from, the identity of the host target genes which VGAM120 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9675] Nucleotide sequences of the VGAM120 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM120 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM120 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM120 are further described hereinbelow with reference to Table 1.

[9676] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM120 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM120 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9677] As mentioned hereinabove with reference to Fig. 1, a function of VGAM120 gene, herein designated VGAM is inhibition of expression of VGAM120 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM120 correlate with, and may be deduced from, the identity of the target genes which VGAM120 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9678] Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383) is a VGAM120 host target gene. ADCY2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by ADCY2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of ADCY2 BINDING SITE, designated SEQ ID:32436, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9679] A function of VGAM120 is therefore inhibition of Adenylate Cyclase 2 (brain) (ADCY2, Accession XM_036383), a gene which Adenylate cyclase (type 2), an ATP-pyrophosphate lyase; converts ATP to cAMP. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ADCY2. The function of ADCY2 has been established by previous studies. Stengel et al. (1992) identified a brain cDNA corresponding to a gene that encodes a human brain adenylyl cyclase, which they symbolized HBAC2. The amino acid sequence of ADCY2 displayed significant homology with ADCY8 (OMIM Ref. No. 103070) in the highly conserved adenylyl cyclase domain (250 amino acids) found in the 3-prime cytoplasmic portion of all mammalian adenylyl cyclases. However, outside this domain, the homology was extremely low. By in situ hybridization to metaphase chromosomal spreads using a human brain cDNA probe, they demonstrated that the ADCY2 gene maps to 5p15.3. There was no cross-reactivity with the

site on 8q24.2 where ADCY8 was found to map. Using Southern blot analysis of somatic cell hybrid DNAs, Gaudin et al. (1994) likewise mapped type II adenylyl cyclase to chromosome 5. Furthermore, they determined the chromosomal location of 4 other isoforms: type III on chromosome 2, type IV on chromosome 14, type V on chromosome 3, and type VI on chromosome 12. By fluorescence in situ hybridization, Edelhoff et al. (1995) mapped the mouse homolog to chromosome 13 in the C1 region. Wong et al. (2000) identified the presence of adenylyl cyclases 2, 3 (OMIM Ref. No. 600291), and 4 (OMIM Ref. No. 600292) in olfactory cilia.

[9680] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9681] Edelhoff, S.; Villacres, E. C.; Storm, D. R.; Disteché, C. M. : Mapping of adenylyl cyclase genes type I, II, III, IV, V, and VI in mouse. *Mammalian Genome* 6: 111–113, 1995. ; and

[9682] Wong, S. T.; Trinh, K.; Hacker, B.; Chan, G. C. K.; Lowe, G.; Gaggari, A.; Xia, Z.; Gold, G. H.; Storm, D. R. : Disruption of the type III adenylyl cyclase gene leads to peripheral and be.

[9683] Further studies establishing the function and utilities of

ADCY2 are found in John Hopkins OMIM database record ID 103071, and in cited publications numbered 494–495, 49 and 496 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Alpha-methylacyl-CoA Racemase (AMACR, Accession XM_043771) is another VGAM120 host target gene. AMACR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by AMACR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of AMACR BINDING SITE, designated SEQ ID:34015, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9684] Another function of VGAM120 is therefore inhibition of Alpha-methylacyl-CoA Racemase (AMACR, Accession XM_043771). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with AMACR. Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992) is another VGAM120 host target gene. CASP6 BINDING SITE1 and CASP6 BINDING SITE2 are HOST

TARGET binding sites found in untranslated regions of mRNA encoded by CASP6, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CASP6 BINDING SITE1 and CASP6 BINDING SITE2, designated SEQ ID:26873 and SEQ ID:6894 respectively, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9685] Another function of VGAM120 is therefore inhibition of Caspase 6, Apoptosis-related Cysteine Protease (CASP6, Accession NM_032992), a gene which involves in the activation cascade of caspases responsible for apoptosis execution. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CASP6. The function of CASP6 has been established by previous studies. Fernandes-Alnemri et al. (1995) isolated MCH2, a member of the ced-3 subfamily of apoptotic proteases, by performing PCR on human Jurkat T lymphocytes using degenerate oligonucleotides corresponding to conserved peptides in known apoptotic cysteine proteases. The gene, also symbolized CASP6, encodes a 34-kD protein that is highly homolo-

gous to human CPP32 (OMIM Ref. No. 600636), *C. elegans* ced-3, mammalian Ich1/Nedd2 (OMIM Ref. No. 600639), and mammalian interleukin-1-beta converting enzyme (OMIM Ref. No. 147678). Fernandes-Alnemri et al. (1995) observed 1.7-kb (alpha) and 1.4-kb (beta) transcripts expressed in Jurkat lymphocytes and other cell lines. The authors suggested that these transcripts are alternate splicing variants and found that the alpha, but not the beta, MCH2 protein has protease activity. They also found that MCH2-alpha protein can cleave poly(ADP-ribose) polymerase (OMIM Ref. No. 173870) in vitro and that its overexpression induces apoptosis in insect Sf9 cells, suggesting that MCH2 is a mediator of apoptosis in mammalian cells. Using protease assays and immunoblotting experiments, Orth et al. (1996) showed that MCH2, like CPP32 and MCH3, functions downstream of the mammalian cell death inhibitors Bcl2 (OMIM Ref. No. 151430) and BclXL and of the viral serpin CrmA. Further, they found that granzyme B can functionally activate MCH2, supporting the idea that granzyme B kills cells by activating downstream components of the CED-3/ICE apoptotic pathway. Orth et al. (1996) also showed that MCH2, unlike CPP32 and MCH3, can cleave lamin A to its signature

apoptotic fragment.

[9686] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9687] Fernandes-Alnemri, T.; Litwack, G.; Alnemri, E. S. : Mch2, a new member of the apoptotic Ced-3/Ice cysteine protease gene family. Cancer Res. 55: 2737-2742, 1995. ; and

[9688] Orth, K.; Chinnaiyan, A. M.; Garg, M.; Froelich, C. J.; Dixit, V. M. : The CED-3/ICE-like protease Mch2 is activated during apoptosis and cleaves the death substrate lamin A. J. Biol. Ch.

[9689] Further studies establishing the function and utilities of CASP6 are found in John Hopkins OMIM database record ID 601532, and in cited publications numbered 7200, 720 and 7202 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474) is another VGAM120 host target gene. GALNT1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GALNT1, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GALNT1 BINDING SITE, designated SEQ ID:21724, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9690] Another function of VGAM120 is therefore inhibition of UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase 1 (GalNAc-T1) (GALNT1, Accession NM_020474), a gene which transfers an N-acetyl galactosamine (GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GALNT1. The function of GALNT1 has been established by previous studies. UDP-N-acetyl-alpha-D-galactosamine:polypeptide N-acetylgalactosaminyltransferase (GalNAc-T; EC 2.4.1.41) transfers an N-acetyl galactosamine (OMIM Ref. No. GalNAc) to a serine or threonine residue in the first step of O-linked oligosaccharide biosynthesis. Takai et al. (1997) cloned the GALNT1 gene, termed GalNAc-T1 by them, from human colon tissue, using a reverse transcriptase

polymerase chain reaction (OMIM Ref. No. RT-PCR) with oligonucleotide primers based on the nucleotide sequence of bovine GalNAc-T1 cDNA. The predicted GALNT1 protein is 559 amino acids long and has 99.6% sequence similarity with the bovine protein. White et al. (1995) isolated cDNAs encoding human GalNAc-T1 and GalNAc-T2 (GALNT2; 602274). Bennett et al. (1998) found that the GALNT1, GALNT2, and GALNT3 (OMIM Ref. No. 601756) genes contain 11, 16, and 10 exons, respectively. Several intron/exon boundaries were conserved within the 3 genes. By fluorescence in situ hybridization, Takai et al. (1997) mapped the GALNT1 gene to chromosome 18q12.1. By the same method, Bennett et al. (1998) mapped the gene to 18q12-q21.

[9691] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9692] Bennett, E. P.; Weghuis, D. O.; Merkx, G.; Geurts van Kessel, A.; Eiberg, H.; Clausen, H. : Genomic organization and chromosomal localization of three members of the UDP-N-acetylgalactosamine:polypeptide N-acetylgalactosaminyltransferase family. *Glycobiology* 8: 547-555, 1998. ; and

- [9693] Takai, S.; Hinoda, Y.; Adachi, T.; Imai, K.; Oshima, M. : A human UPD (sic)-GalNAc: polypeptide, N-acetylgalactosaminyltransferase type 1 gene is located at the chromosomal region 18q12.
- [9694] Further studies establishing the function and utilities of GALNT1 are found in John Hopkins OMIM database record ID 602273, and in cited publications numbered 2824-2798 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450) is another VGAM120 host target gene. KLHL3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KLHL3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KLHL3 BINDING SITE, designated SEQ ID:42272, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.
- [9695] Another function of VGAM120 is therefore inhibition of Kelch-like 3 (Drosophila) (KLHL3, Accession XM_113450). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions

associated with KLHL3. Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694) is another VGAM120 host target gene. PKHD1 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PKHD1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PKHD1 BINDING SITE, designated SEQ ID:28944, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9696] Another function of VGAM120 is therefore inhibition of Polycystic Kidney and Hepatic Disease 1 (autosomal recessive) (PKHD1, Accession NM_138694). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PKHD1. Pinin, Desmosome Associated Protein (PNN, Accession XM_048719) is another VGAM120 host target gene. PNN BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PNN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Ta-

ble 2 illustrates the complementarity of the nucleotide sequences of PNN BINDING SITE, designated SEQ ID:35234, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9697] Another function of VGAM120 is therefore inhibition of Pinin, Desmosome Associated Protein (PNN, Accession XM_048719), a gene which reinforces the intermediate filament–desmosome complex. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PNN. The function of PNN has been established by previous studies. Desmosomes are intimately involved in the structural and functional integration of adjacent epithelial cells. They serve as reinforcement sites of cell–cell adhesion, as well as points for lateral anchorage of the intermediate scaffold of the epithelial cell. A number of proteins associated with desmosomes have been identified, including desmoplakin (OMIM Ref. No. 125647), plakoglobin (OMIM Ref. No. 173325), desmogleins (e.g., 125670), and desmocollins (e.g., 125643). Ouyang and Sugrue (1996) identified a novel phosphoprotein, called pinin, that associates with mature desmosomes. By screening a human placenta cDNA library with a canine pinin cDNA cloned by them,

they isolated cDNAs encoding PNN. The deduced 743-amino acid PNN protein contains a serine-rich domain; a glutamine-proline, glutamine-leucine repeat domain; an acidic domain rich in glutamic acid; and numerous potential kinase recognition motifs. Recombinant PNN migrated as a 140-kD protein by Western blot analysis. Ouyang and Sugrue (1996) found that recombinant pinin was expressed along the lateral borders of human embryonic kidney-derived 293 cells, in association with desmoplakin; they noted striking changes in cell/tissue morphology. Northern blot analysis detected ubiquitous expression of PNN in human tissues, including those lacking desmosomes. PNN is expressed as 4.1-, 3.7-, and 3.2-kb transcripts that show tissue-specific expression patterns. Southern blot analysis demonstrated the existence of a single pinin gene in the human genome. Since the 3-prime end of the PNN coding sequence is nearly identical to a partial cDNA identified in a pig neutrophil cDNA library, and since leukocytes, which do not react with antibodies against pinin, express an mRNA that hybridizes with a pinin cDNA, the authors speculated that there may be a pinin-related gene. By screening a keratinocyte cDNA library, Brandner et al. (1997) and Brandner et al. (1998)

isolated a cDNA encoding a protein, which they called DRS (domain rich in serine), that is essentially identical to the PNN protein described by Ouyang and Sugrue (1996).

However, cell fractionation and immunofluorescence microscopy analysis localized DRS strictly to the nucleus and not to desmosomes. Sequence analysis predicted that the 717-amino acid DRS protein contains an N-terminal nuclear localization signal and a C-terminal stretch of approximately 80 amino acids, 73% of which are serine. The 80-amino acid C-terminal domain and a subsequent 79-amino acid domain also contain numerous ser-arg and arg-ser dipeptides.

[9698] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9699] Ouyang, P.; Sugrue, S. P. : Characterization of pinin, a novel protein associated with the desmosome-intermediate filament complex. *J. Cell Biol.* 135: 1027-1042, 1996.
; and

[9700] Brandner, J. M.; Reidenbach, S.; Kuhn, C.; Franke, W. W. : Identification and characterization of a novel kind of nuclear protein occurring free in nucleoplasm and in ribonucleoprotein st.

[9701] Further studies establishing the function and utilities of PNN are found in John Hopkins OMIM database record ID 603154, and in cited publications numbered 2423–2426 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Palmitoyl–protein Thioesterase 2 (PPT2, Accession NM_138717) is another VGAM120 host target gene. PPT2 BINDING SITE1 and PPT2 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by PPT2, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPT2 BINDING SITE1 and PPT2 BINDING SITE2, designated SEQ ID:28964 and SEQ ID:11633 respectively, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9702] Another function of VGAM120 is therefore inhibition of Palmitoyl–protein Thioesterase 2 (PPT2, Accession NM_138717), a gene which is a palmitoyl–protein thioesterase 2 which possesses a different substrate specificity than PPT1. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPT2. The function

of PPT2 has been established by previous studies. Palmitoyl-protein thioesterase-1 (PPT1; 600722) is a lysosomal hydrolase that removes long-chain fatty acyl groups from modified cysteine residues in proteins. Mutations in PPT1 have been found to cause the infantile form of neuronal ceroid lipofuscinosis (INCL; 256730). By searching sequence databases for homologs of PPT1, Soyombo and Hofmann (1997) identified cDNAs encoding PPT2. The deduced PPT2 protein contains 302 amino acids, including a 27-amino acid leader peptide, a sequence motif characteristic of many thioesterases and lipases, and 5 potential N-linked glycosylation sites. PPT2 shares 18% amino acid identity with PPT1. Northern blot analysis detected a predominant 2.0-kb PPT2 transcript in the human tissues examined, with the highest expression in skeletal muscle; variable amounts of 2.8- and 7.0-kb transcripts were also observed. Immunoblot analysis of recombinant PPT2 expressed in mammalian cells showed 6 PPT2 proteins ranging in size from 31 to 42 kD. Treatment that removes asparagine-linked oligosaccharides resulted in a single major protein of 31 kD and a minor protein of 33 kD. The authors demonstrated that recombinant PPT2, like PPT1, possesses thioesterase activity and localizes to the lyso-

some. Since PPT2 could not substitute for PPT1 in correcting the metabolic defect in INCL cells and was unable to remove palmitate groups from palmitoylated proteins that are routinely used as substrates for PPT1, Soyombo and Hofmann (1997) suggested that PPT2 possesses a different substrate specificity than PPT1. Animal model experiments lend further support to the function of PPT2. Gupta et al. (2001) engineered disruptions in the Ppt1 and Ppt2 genes to create knockout mice that were deficient in either enzyme. Both lines of mice were viable and fertile; however, both lines developed spasticity (a 'claspings' phenotype) at a median age of 21 weeks and 29 weeks, respectively. Motor abnormalities progressed in the Ppt1 knockout mice, leading to death by 10 months of age. In contrast, most Ppt2 mice were alive at 12 months. Myoclonic jerking and seizures were prominent in the Ppt1 mice. Autofluorescent storage material was striking throughout the brains of both strains of mice. Neuronal loss and apoptosis were particularly prominent in Ppt1-deficient brains. These studies provided a mouse model for infantile neuronal ceroid lipofuscinosis and further suggested that PPT2 serves a role in the brain that is not carried out by PPT1.

[9703] It is appreciated that the abovementioned animal model for PPT2 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9704] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9705] Gupta, P.; Soyombo, A. A.; Atashband, A.; Wisniewski, K. E.; Shelton, J. M.; Richardson, J. A.; Hammer, R. E.; Hofmann, S. L. : Disruption of PPT1 or PPT2 causes neuronal ceroid lipofuscinosis in knockout mice. Proc. Nat. Acad. Sci. 98: 13566–13571, 2001. ; and

[9706] Soyombo, A. A.; Hofmann, S. L. : Molecular cloning and expression of palmitoyl–protein thioesterase 2 (PPT2), a homolog of lysosomal palmitoyl–protein thioesterase with a distinct subs.

[9707] Further studies establishing the function and utilities of PPT2 are found in John Hopkins OMIM database record ID 603298, and in cited publications numbered 6567 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Protein Kinase, CAMP–dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM_002736) is another VGAM120 host target gene.

PRKAR2B BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PRKAR2B, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRKAR2B BINDING SITE, designated SEQ ID:8611, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9708] Another function of VGAM120 is therefore inhibition of Protein Kinase, CAMP-dependent, Regulatory, Type II, Beta (PRKAR2B, Accession NM_002736), a gene which type II regulatory chains mediate membrane association by binding to anchoring proteins, including the map2 kinase. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRKAR2B. The function of PRKAR2B has been established by previous studies. Using both a rat skeletal muscle clone and a human clone of type II regulatory subunit of cyclic AMP-dependent protein kinase, Scambler et al. (1987) demonstrated that the human gene is located on chromosome 7, close to but separate from the cystic fibrosis locus (OMIM Ref. No. 219700). These conclusions

were based on Southern blot analysis of DNA from hybrid cell lines containing only chromosome 7 or parts thereof, as well as human/mouse hybrid cell lines established by means of chromosome-mediated gene transfer (CMGT) using MET (OMIM Ref. No. 164860) as a dominant selectable marker. Independence of PKR2 from CF was also indicated by family linkage studies using a RFLP of the PKR2 probe. Wainwright et al. (1987) showed that PKR2 is linked to several markers on 7q. The closest and strongest linkage was to TCRB (OMIM Ref. No. 186930), which showed a maximum lod score of 3.01 at $\theta = 0.00$. Using RFLPs in the CEPH panel of 40 families, Solberg et al. (1992) mapped the regulatory subunit RII-beta of cAMP-dependent protein kinase to 7q. They constructed a 7-point framework map including PRKAR2B and demonstrated the following order: cen--D7S371--(COL1A2, D7S79)--PRKAR2B--MET--D7S87--TCRB--qter. Furthermore, by in situ hybridization to metaphase chromosomes, Solberg et al. (1992) physically mapped PRKAR2B to 7q22. Cummings et al. (1996) generated knockout mice for the cyclic AMP dependent protein kinase regulatory subunit type II-beta (designated RII-beta by them). They reported that the mutants appeared healthy but had

markedly diminished white adipose tissue despite normal food intake and were protected against developing diet-induced obesity and fatty livers. In the mutant mice, brown adipose tissue demonstrated a compensatory increase in RI-alpha (OMIM Ref. No. 188830). Cummings et al. (1996) reported that RII-beta mutants exhibited markedly reduced leptin (OMIM Ref. No. 164160) mRNA and plasma levels; however, only mild hyperphagia was present

[9709] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9710] Cummings, D. E.; Brandon, E. P.; Planas, J. V.; Motamed, K.; Idzerda, R. L.; McKnight, G. S. : Genetically lean mice result from targeted disruption of the RII-beta subunit of protein kinase A. Nature 382: :622-626, 1996. ; and

[9711] Scambler, P.; Oyen, O.; Wainwright, B.; Farrall, M.; Law, H.-Y.; Estivill, X.; Sandberg, M.; Williamson, R.; Jahnsen, T. : Exclusion of catalytic and regulatory subunits of cAMP-dependen.

[9712] Further studies establishing the function and utilities of PRKAR2B are found in John Hopkins OMIM database record ID 176912, and in sited publications numbered

1157–1158, 115 and 1159 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RAB18, Member RAS Oncogene Family (RAB18, Accession NM_021252) is another VGAM120 host target gene. RAB18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RAB18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RAB18 BINDING SITE, designated SEQ ID:22222, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9713] Another function of VGAM120 is therefore inhibition of RAB18, Member RAS Oncogene Family (RAB18, Accession NM_021252), a gene which plays a role in apical endocytosis/recycling. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RAB18. The function of RAB18 has been established by previous studies. Rab proteins are members of a family of Ras-related small GTPases that regulate membrane trafficking in organelles and transport vesicles. By stimulating umbilical vein en-

endothelial cells (HUVEC) with histamine and differential display gene expression analysis, Schafer et al. (2000) isolated a cDNA encoding RAB18. The deduced 206-amino acid protein shares 98%, 92%, and 85% identity with the mouse, snail, and worm sequences, respectively. RAB18 contains totally conserved phosphate/Mg(2+)-binding motifs and guanine-binding motifs as well as somewhat variable organelle-targeting regions. Northern blot analysis detected 2.5- and 1.0-kb transcripts in endothelial cells but not in smooth muscle cells or leukocytes. RT-PCR analysis suggested ubiquitous expression, which HPLC analysis determined to be strongest in heart, kidney, pancreas, lung, and liver, with weak expression in brain, placenta, and skeletal muscle. Stimulation of polarized HUVEC or nonpolarized mononuclear cells with histamine showed a significant time- and dose-dependent increase of RAB18 transcript in both cell types, suggesting a possible role for Rab proteins in inflammation. McMurtrie et al. (1997) mapped the mouse Rab18 gene to chromosome 18. They predicted that a human Rab18 homolog would map to 18q11-q12 or 10p11.

[9714] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [9715] McMurtrie, E. B.; Barbosa, M. D. F. S.; Zerial, M.; Kingsmore, S. F. : Rab17 and Rab18, small GTPases with specificity for polarized epithelial cells: genetic mapping in the mouse. *Genomics* 45: 623–625, 1997. ; and

- [9717] Further studies establishing the function and utilities of RAB18 are found in John Hopkins OMIM database record ID 602207, and in cited publications numbered 8841–8842 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. RecQ Protein-like 5 (RECQL5, Accession NM_004259) is another VGAM120 host target gene. RECQL5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RECQL5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RECQL5 BINDING SITE, designated SEQ ID:10451, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA,

also designated SEQ ID:2831.

[9718] Another function of VGAM120 is therefore inhibition of RecQ Protein-like 5 (RECQL5, Accession NM_004259). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RECQL5. Splicing Factor, Arginine/serine-rich 2 (SFRS2, Accession XM_036785) is another VGAM120 host target gene. SFRS2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SFRS2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SFRS2 BINDING SITE, designated SEQ ID:32505, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9719] Another function of VGAM120 is therefore inhibition of Splicing Factor, Arginine/serine-rich 2 (SFRS2, Accession XM_036785), a gene which is necessary for the splicing of pre-mrna. Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SFRS2. The function of SFRS2 and its association with various diseases and clinical con-

ditions, has been established by previous studies, as described hereinabove with reference to VGAM47. Tripartite Motif-containing 34 (TRIM34, Accession NM_021616) is another VGAM120 host target gene. TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by TRIM34, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TRIM34 BINDING SITE1 and TRIM34 BINDING SITE2, designated SEQ ID:22253 and SEQ ID:28177 respectively, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9720] Another function of VGAM120 is therefore inhibition of Tripartite Motif-containing 34 (TRIM34, Accession NM_021616). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TRIM34. CSE-C (Accession XM_166163) is another VGAM120 host target gene. CSE-C BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSE-C, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSE-C BINDING SITE, designated SEQ ID:43980, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9721] Another function of VGAM120 is therefore inhibition of CSE-C (Accession XM_166163). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSE-C. FLJ10482 (Accession NM_018107) is another VGAM120 host target gene. FLJ10482 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10482, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10482 BINDING SITE, designated SEQ ID:19876, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9722] Another function of VGAM120 is therefore inhibition of FLJ10482 (Accession NM_018107). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10482.

FLJ11149 (Accession NM_018339) is another VGAM120 host target gene. FLJ11149 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11149, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11149 BINDING SITE, designated SEQ ID:20346, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9723] Another function of VGAM120 is therefore inhibition of FLJ11149 (Accession NM_018339). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11149. FLJ11275 (Accession NM_018376) is another VGAM120 host target gene. FLJ11275 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11275 BINDING SITE, designated SEQ ID:20404, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2831.

[9724] Another function of VGAM120 is therefore inhibition of FLJ11275 (Accession NM_018376). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11275. FLJ14326 (Accession NM_032191) is another VGAM120 host target gene. FLJ14326 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by FLJ14326, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ14326 BINDING SITE, designated SEQ ID:25904, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9725] Another function of VGAM120 is therefore inhibition of FLJ14326 (Accession NM_032191). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ14326. FLJ20527 (Accession NM_017863) is another VGAM120 host target gene. FLJ20527 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20527, corresponding to a HOST TARGET

binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20527 BINDING SITE, designated SEQ ID:19540, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9726] Another function of VGAM120 is therefore inhibition of FLJ20527 (Accession NM_017863). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20527. KIAA1464 (Accession XM_043069) is another VGAM120 host target gene. KIAA1464 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1464, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1464 BINDING SITE, designated SEQ ID:33883, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9727] Another function of VGAM120 is therefore inhibition of KIAA1464 (Accession XM_043069). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with KIAA1464. MGC13183 (Accession NM_032358) is another VGAM120 host target gene. MGC13183 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC13183, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC13183 BINDING SITE, designated SEQ ID:26146, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9728] Another function of VGAM120 is therefore inhibition of MGC13183 (Accession NM_032358). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC13183. MGC16142 (Accession NM_032763) is another VGAM120 host target gene. MGC16142 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC16142, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC16142 BINDING SITE, designated SEQ ID:26507, to

the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9729] Another function of VGAM120 is therefore inhibition of MGC16142 (Accession NM_032763). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC16142. Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_024494) is another VGAM120 host target gene. WNT2B BINDING SITE1 and WNT2B BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by WNT2B, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of WNT2B BINDING SITE1 and WNT2B BINDING SITE2, designated SEQ ID:23694 and SEQ ID:10393 respectively, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9730] Another function of VGAM120 is therefore inhibition of Wingless-type MMTV Integration Site Family, Member 2B (WNT2B, Accession NM_024494). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with WNT2B. LOC147622 (Accession XM_097255) is another VGAM120 host target gene. LOC147622 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147622, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147622 BINDING SITE, designated SEQ ID:40851, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9731] Another function of VGAM120 is therefore inhibition of LOC147622 (Accession XM_097255). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147622. LOC150630 (Accession XM_097931) is another VGAM120 host target gene. LOC150630 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC150630, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC150630 BINDING SITE, designated SEQ ID:41243, to

the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9732] Another function of VGAM120 is therefore inhibition of LOC150630 (Accession XM_097931). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC150630. LOC155081 (Accession XM_088145) is another VGAM120 host target gene. LOC155081 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC155081, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC155081 BINDING SITE, designated SEQ ID:39546, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9733] Another function of VGAM120 is therefore inhibition of LOC155081 (Accession XM_088145). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC155081. LOC196812 (Accession XM_116868) is another VGAM120 host target gene. LOC196812 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC196812, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC196812 BINDING SITE, designated SEQ ID:43135, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9734] Another function of VGAM120 is therefore inhibition of LOC196812 (Accession XM_116868). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC196812. LOC221421 (Accession XM_166428) is another VGAM120 host target gene. LOC221421 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC221421, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221421 BINDING SITE, designated SEQ ID:44326, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9735] Another function of VGAM120 is therefore inhibition of LOC221421 (Accession XM_166428). Accordingly, utilities

of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221421. LOC222228 (Accession XM_168627) is another VGAM120 host target gene. LOC222228 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222228, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC222228 BINDING SITE, designated SEQ ID:45277, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9736] Another function of VGAM120 is therefore inhibition of LOC222228 (Accession XM_168627). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222228. LOC222233 (Accession XM_168560) is another VGAM120 host target gene. LOC222233 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC222233, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC222233 BINDING SITE, designated SEQ ID:45246, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9737] Another function of VGAM120 is therefore inhibition of LOC222233 (Accession XM_168560). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC222233. LOC90906 (Accession XM_034809) is another VGAM120 host target gene. LOC90906 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90906, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90906 BINDING SITE, designated SEQ ID:32152, to the nucleotide sequence of VGAM120 RNA, herein designated VGAM RNA, also designated SEQ ID:2831.

[9738] Another function of VGAM120 is therefore inhibition of LOC90906 (Accession XM_034809). Accordingly, utilities of VGAM120 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90906. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the

present invention, referred to here as Viral Genomic Address Messenger 121 (VGAM121) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9739] VGAM121 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM121 was detected is described hereinabove with reference to Figs. 1–8.

[9740] VGAM121 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9741] VGAM121 gene encodes a VGAM121 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM121 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM121 precursor RNA is designated SEQ ID:107, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:107 is located at position 104845 relative to the genome of

Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9742] VGAM121 precursor RNA folds onto itself, forming VGAM121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9743] An enzyme complex designated DICER COMPLEX, `dices` the VGAM121 folded precursor RNA into VGAM121 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM121 RNA is designated SEQ ID:2832, and is provided hereinbelow with reference to the sequence listing part.

[9744] VGAM121 host target gene, herein designated VGAM

HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM121 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5' untranslated region, a protein coding region and a 3' untranslated region, designated 5' UTR, PROTEIN CODING and 3' UTR respectively.

[9745] VGAM121 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM121 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM121 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM121 host target RNA,

herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3' UTR region, this is meant as an example only – these host target binding sites may be located in the 3' UTR region, the 5' UTR region, or in both 3' UTR and 5' UTR regions.

[9746] The complementary binding of VGAM121 RNA, herein designated VGAM RNA, to host target binding sites on VGAM121 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM121 host target RNA into VGAM121 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9747] It is appreciated that VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM121 host target genes. The mRNA of each one of this plurality of VGAM121 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM121 RNA, herein designated VGAM RNA, and which when bound by VGAM121 RNA causes inhibition of translation of respective one or more VGAM121

host target proteins.

[9748] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM121 gene, herein designated VGAM GENE, on one or more VGAM121 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9749] It is yet further appreciated that a function of VGAM121 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syn-

drome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM121 correlate with, and may be deduced from, the identity of the host target genes which VGAM121 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9750] Nucleotide sequences of the VGAM121 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM121 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM121 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM121 are further described hereinbelow with reference to Table 1.

[9751] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM121 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM121 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9752] As mentioned hereinabove with reference to Fig. 1, a function of VGAM121 gene, herein designated VGAM is inhibition of expression of VGAM121 target genes. It is

appreciated that specific functions, and accordingly utilities, of VGAM121 correlate with, and may be deduced from, the identity of the target genes which VGAM121 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9753] C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 12 (CLECSF12, Accession XM_084768) is a VGAM121 host target gene.

CLECSF12 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by CLECSF12, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CLECSF12 BINDING SITE, designated SEQ ID:37685, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9754] A function of VGAM121 is therefore inhibition of C-type (calcium dependent, carbohydrate-recognition domain) Lectin, Superfamily Member 12 (CLECSF12, Accession XM_084768), a gene which is a pattern-recognition receptor . Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical con-

ditions associated with CLECSF12. The function of CLECSF12 has been established by previous studies. Yokota et al. (2001) cloned human dectin-1 using degenerative PCR amplification of mRNA isolated from dendritic cells and subsequent cDNA cloning. The human dectin-1 gene encodes a polypeptide of 247 amino acids, 3 amino acids longer than the mouse protein. Dectin-1 contains an immunoreceptor tyrosine-based activation motif within the cytoplasmic domain. Human dectin-1 mRNA is expressed predominantly in peripheral blood leukocytes and preferentially by dendritic cells. The mRNA encodes a 33-kD glycoprotein. In human epidermis, the protein is expressed selectively by Langerhans cells, which are an epidermal subset of dendritic cells. A truncated form of dectin-1 RNA encodes a polypeptide lacking almost the entire neck domain, which is required for accessibility of the carbohydrate recognition domain to ligands. Truncated dectin is produced by alternative splicing. Brown and Gordon (2001) identified dectin-1 as a beta-glucan receptor present on macrophages. In contrast to its reported specificity for dendritic cells (Yokota et al. (2001), Brown and Gordon (2001)) found that dectin-1 was expressed in every macrophage population examined and in

more tissues than was previously reported with the highest expression being in the liver, lung, and thymus. Brown and Gordon (2001) found that dectin-1 is a pattern-recognition receptor that recognizes a variety of beta-1,3-linked and beta-1,6-linked glucans from fungi and plants. Dectin-1 did not recognize monosaccharides or carbohydrates with different linkages. Laminarin and glucan phosphate, a structurally defined immunologically active beta-glucan, were the most effective inhibitors; both bind to the beta-glucan receptor on monocytes and macrophages. Soluble recombinant dectin-1 stimulates the proliferation of T lymphocytes (Ariizumi et al. (2000)). In a whole-cell binding assay, binding of T cells to NIH 3T3 cells expressing dectin-1 was not inhibited by beta-glucans. Therefore, Brown and Gordon (2001) concluded that dectin-1 has 2 ligand binding sites: one that recognizes an endogenous ligand on T cells, and another for exogenous carbohydrates.

[9755] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9756] Ariizumi, K.; Shen, G.-L.; Shikano, S.; Xu, S.; Ritter, R., III; Kumamoto, T.; Edelbaum, D.; Morita, A.; Bergstresser, P.

R.; Takashima, A. : Identification of a novel, dendritic cell-associated molecule, dectin-1, by subtractive cDNA cloning. J. Biol. Chem. 275: 20157-20167, 2000. ; and

[9757] Brown, G. D.; Gordon, S. : A new receptor for beta-glucans. Nature 413: 36-37, 2001.

[9758] Further studies establishing the function and utilities of CLECSF12 are found in John Hopkins OMIM database record ID 606264, and in cited publications numbered 910-913 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Deoxyguanosine Kinase (DGUOK, Accession NM_080915) is another VGAM121 host target gene. DGUOK BINDING SITE1 and DGUOK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by DGUOK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DGUOK BINDING SITE1 and DGUOK BINDING SITE2, designated SEQ ID:28134 and SEQ ID:28138 respectively, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9759] Another function of VGAM121 is therefore inhibition of

Deoxyguanosine Kinase (DGUOK, Accession NM_080915), a gene which is deoxyguanosine kinase and mediates phosphorylation of several deoxyribonucleosides. Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DGUOK. The function of DGUOK has been established by previous studies. Mitochondrial DNA depletion syndromes (OMIM Ref. No. 251880) are phenotypically heterogeneous, autosomal recessive disorders characterized by tissue-specific reduction in mtDNA copy number. Affected individuals with the hepatocerebral form of mtDNA depletion syndrome have early progressive liver failure and neurologic abnormalities, hypoglycemia, and increased lactate in body fluids. Affected tissues show both decreased activity of the mtDNA-encoded respiratory chain complexes (I, III, IV, and V) and mtDNA depletion. Mandel et al. (2001) used homozygosity mapping in 3 kindreds of Druze origin to map the hepatocerebral mtDNA depletion syndrome locus to a region of 6.1 cM on chromosome 2p13. This interval encompasses the DGUOK gene. They identified a 1-bp deletion (601465.0001) within the DGUOK gene that segregated with the disease in the 3 kindreds studied. Western blot analysis failed to

detect DGK protein in the liver of affected persons. The main supply of deoxyribonucleotides (dNTPs) for mtDNA synthesis comes from the salvage pathway initiated by DGK and thymidine kinase-2 (TK2; 188250). The association of mtDNA depletion with mutated DGUOK suggested that the salvage pathway enzymes are involved in the maintenance of balanced mitochondrial dNTP pools. In 2 German brothers with the hepatocerebral form of mitochondrial DNA-depletion syndrome (OMIM Ref. No. 251880) characterized by lactic acidosis, hepatomegaly, hypoglycemia, jaundice, and encephalopathy with hypotonia, hyperreflexia, and nystagmus, Taanman et al. (2002) identified a homozygous nonsense mutation in exon 3 of the DGUOK gene, 313C-T, resulting in a 173-amino acid truncation at the C terminus of the protein product. The unaffected parents were heterozygous for the mutation.

[9760] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9761] Mandel, H.; Szargel, R.; Labay, V.; Elpeleg, O.; Saada, A.; Shalata, A.; Anbinder, Y.; Berkowitz, D.; Hartman, C.; Barak, M.; Eriksson, S.; Cohen, N. : The deoxyguanosine kinase gene is mutated in individuals with depleted hepa-

tocerebral mitochondrial DNA. Nature Genet. 29: 337–341, 2001. Note: Erratum: Nature Genet. 29: 491 only, 2001. ; and

[9762] Taanman, J.-W.; Kateeb, I.; Muntau, A. C.; Jaksch, M.; Cohen, N.; Mandel, H. : A novel mutation in the deoxyguanosine kinase gene causing depletion of mitochondrial DNA. Ann. Neurol. 5.

[9763] Further studies establishing the function and utilities of DGUOK are found in John Hopkins OMIM database record ID 601465, and in cited publications numbered 275 and 10086 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Sperm Associated Antigen 6 (SPAG6, Accession NM_012443) is another VGAM121 host target gene. SPAG6 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SPAG6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SPAG6 BINDING SITE, designated SEQ ID:14817, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9764] Another function of VGAM121 is therefore inhibition of

Sperm Associated Antigen 6 (SPAG6, Accession NM_012443). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SPAG6. Tensin (TNS, Accession NM_022648) is another VGAM121 host target gene. TNS BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TNS, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TNS BINDING SITE, designated SEQ ID:22901, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9765] Another function of VGAM121 is therefore inhibition of Tensin (TNS, Accession NM_022648). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TNS. FLJ10759 (Accession NM_018207) is another VGAM121 host target gene. FLJ10759 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10759, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ10759 BINDING SITE, designated SEQ ID:20099, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9766] Another function of VGAM121 is therefore inhibition of FLJ10759 (Accession NM_018207). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10759. FLJ10815 (Accession NM_018231) is another VGAM121 host target gene. FLJ10815 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ10815, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ10815 BINDING SITE, designated SEQ ID:20172, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9767] Another function of VGAM121 is therefore inhibition of FLJ10815 (Accession NM_018231). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10815. FLJ11259 (Accession NM_018370) is another VGAM121

host target gene. FLJ11259 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ11259, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11259 BINDING SITE, designated SEQ ID:20381, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9768] Another function of VGAM121 is therefore inhibition of FLJ11259 (Accession NM_018370). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11259. FLJ30567 (Accession NM_145022) is another VGAM121 host target gene. FLJ30567 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ30567, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ30567 BINDING SITE, designated SEQ ID:29632, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9769] Another function of VGAM121 is therefore inhibition of FLJ30567 (Accession NM_145022). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ30567. KIAA1361 (Accession XM_030845) is another VGAM121 host target gene. KIAA1361 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1361, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1361 BINDING SITE, designated SEQ ID:31164, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9770] Another function of VGAM121 is therefore inhibition of KIAA1361 (Accession XM_030845). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1361. LEAP-2 (Accession NM_052971) is another VGAM121 host target gene. LEAP-2 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LEAP-2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LEAP-2 BINDING SITE, designated SEQ ID:27544, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9771] Another function of VGAM121 is therefore inhibition of LEAP-2 (Accession NM_052971). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LEAP-2. P1P373C6 (Accession NM_019110) is another VGAM121 host target gene. P1P373C6 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by P1P373C6, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of P1P373C6 BINDING SITE, designated SEQ ID:21187, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9772] Another function of VGAM121 is therefore inhibition of P1P373C6 (Accession NM_019110). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

P1P373C6. Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463) is another VGAM121 host target gene. PTP4A1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PTP4A1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTP4A1 BINDING SITE, designated SEQ ID:9531, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9773] Another function of VGAM121 is therefore inhibition of Protein Tyrosine Phosphatase Type IVA, Member 1 (PTP4A1, Accession NM_003463). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTP4A1. Unc-5 Homolog D (C. elegans) (UNC5D, Accession NM_080872) is another VGAM121 host target gene. UNC5D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UNC5D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of UNC5D BINDING SITE, designated SEQ ID:28113, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9774] Another function of VGAM121 is therefore inhibition of Unc-5 Homolog D (*C. elegans*) (UNC5D, Accession NM_080872). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UNC5D. LOC143287 (Accession XM_096410) is another VGAM121 host target gene. LOC143287 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC143287, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC143287 BINDING SITE, designated SEQ ID:40343, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9775] Another function of VGAM121 is therefore inhibition of LOC143287 (Accession XM_096410). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC143287. LOC145678 (Accession XM_096832) is another VGAM121 host target gene. LOC145678 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC145678, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC145678 BINDING SITE, designated SEQ ID:40553, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9776] Another function of VGAM121 is therefore inhibition of LOC145678 (Accession XM_096832). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC145678. LOC149506 (Accession XM_097661) is another VGAM121 host target gene. LOC149506 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149506, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149506 BINDING SITE, designated SEQ ID:41003, to the nucleotide sequence of VGAM121 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2832.

[9777] Another function of VGAM121 is therefore inhibition of LOC149506 (Accession XM_097661). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC149506. LOC153020 (Accession XM_087578) is another VGAM121 host target gene. LOC153020 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153020, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153020 BINDING SITE, designated SEQ ID:39352, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9778] Another function of VGAM121 is therefore inhibition of LOC153020 (Accession XM_087578). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153020. LOC255394 (Accession XM_170710) is another VGAM121 host target gene. LOC255394 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC255394, cor-

responding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC255394 BINDING SITE, designated SEQ ID:45480, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9779] Another function of VGAM121 is therefore inhibition of LOC255394 (Accession XM_170710). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC255394. LOC84549 (Accession NM_032509) is another VGAM121 host target gene. LOC84549 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC84549, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC84549 BINDING SITE, designated SEQ ID:26257, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9780] Another function of VGAM121 is therefore inhibition of LOC84549 (Accession NM_032509). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment

of diseases and clinical conditions associated with LOC84549. LOC92391 (Accession XM_044793) is another VGAM121 host target gene. LOC92391 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92391, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92391 BINDING SITE, designated SEQ ID:34272, to the nucleotide sequence of VGAM121 RNA, herein designated VGAM RNA, also designated SEQ ID:2832.

[9781] Another function of VGAM121 is therefore inhibition of LOC92391 (Accession XM_044793). Accordingly, utilities of VGAM121 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92391. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 122 (VGAM122) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9782] VGAM122 is a novel bioinformatically detected regulatory,

non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM122 was detected is described hereinabove with reference to Figs. 1–8.

[9783] VGAM122 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9784] VGAM122 gene encodes a VGAM122 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM122 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM122 precursor RNA is designated SEQ ID:108, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:108 is located at position 205407 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9785] VGAM122 precursor RNA folds onto itself, forming VGAM122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this

`hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9786] An enzyme complex designated DICER COMPLEX, `dices` the VGAM122 folded precursor RNA into VGAM122 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 52%) nucleotide sequence of VGAM122 RNA is designated SEQ ID:2833, and is provided hereinbelow with reference to the sequence listing part.

[9787] VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM122 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN

CODING and 3`UTR respectively.

[9788] VGAM122 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM122 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM122 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9789] The complementary binding of VGAM122 RNA, herein designated VGAM RNA, to host target binding sites on VGAM122 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM122 host target RNA into VGAM122 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9790] It is appreciated that VGAM122 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM122 host target genes. The mRNA of each one of this plurality of VGAM122 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM122 RNA, herein designated VGAM RNA, and which when bound by VGAM122 RNA causes inhibition of translation of respective one or more VGAM122 host target proteins.

[9791] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM122 gene, herein designated VGAM GENE, on one or more VGAM122 host target gene, herein designated

VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9792] It is yet further appreciated that a function of VGAM122 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM122 correlate with, and may be deduced from, the identity of the host target genes which VGAM122 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

- [9793] Nucleotide sequences of the VGAM122 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM122 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM122 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM122 are further described hereinbelow with reference to Table 1.
- [9794] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM122 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM122 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.
- [9795] As mentioned hereinabove with reference to Fig. 1, a function of VGAM122 gene, herein designated VGAM is inhibition of expression of VGAM122 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM122 correlate with, and may be deduced from, the identity of the target genes which VGAM122 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.
- [9796] CREBBP/EP300 Inhibitory Protein 1 (CRI1, Accession

NM_014335) is a VGAM122 host target gene. CRI1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CRI1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CRI1 BINDING SITE, designated SEQ ID:15647, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9797] A function of VGAM122 is therefore inhibition of CREBBP/EP300 Inhibitory Protein 1 (CRI1, Accession NM_014335), a gene which regulates cell cycle as well as tissue-specific transcription and differentiation. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CRI1. The function of CRI1 has been established by previous studies. Miyake et al. (2000) and MacLellan et al. (2000) simultaneously reported isolating cDNAs encoding CRI1, which both groups designated EID1, using yeast 2-hybrid screens with various RB1 fragments as bait. Sequence analysis predicted that the 187-amino acid protein contains 2 acid patches and a C-terminal RB1-binding motif (LXCXE). Northern blot analysis detected ubiquitous ex-

pression of CRI1, with strongest expression in heart, skeletal muscle, and brain. Binding analysis showed that the acid patches and C terminus of CRI1 interacted with RB1 in transfected cells. Overexpression of CRI1 in a skeletal muscle cell line inhibited cell differentiation without reversing the expression of myogenic phenotype markers. Luciferase reporter analysis showed that CRI1 expression inhibits MYOD (OMIM Ref. No. 159970)-dependent transcription through multiple domains and its interaction with EP300 and CREBBP, but CRI1 expression does not affect cell cycle reentry. Miyake et al. (2000) determined that CRI1 interacts with MDM2 (OMIM Ref. No. 164785), leading to the ubiquitination and destruction of CRI1 and thereby coupling cell cycle exit to the execution of a differentiation program.

[9798] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9799] Miyake, S.; Sellers, W. R.; Safran, M.; Li, X.; Zhao, W.; Grossman, S. R.; Gan, J.; DeCaprio, J. A.; Adams, P. D.; Kaelin, W. G., Jr. : Cells degrade a novel inhibitor of differentiation with E1A-like properties upon exiting the cell cycle. *Molec. Cell. Biol.* 20: 8889-8902, 2000. ; and

[9800] MacLellan, W. R.; Xiao, G.; Abdellatif, M.; Schneider, M. D. :
A novel Rb- and p300-binding protein inhibits transactivation by MyoD. *Molec. Cell. Biol.* 20: 8903-8915, 2000.

[9801] Further studies establishing the function and utilities of CRI1 are found in John Hopkins OMIM database record ID 605894, and in cited publications numbered 4766-4768 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190) is another VGAM122 host target gene. TAPBP BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TAPBP, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TAPBP BINDING SITE, designated SEQ ID:9182, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9802] Another function of VGAM122 is therefore inhibition of TAP Binding Protein (tapasin) (TAPBP, Accession NM_003190), a gene which is involved in MHC class I-restricted antigen processing. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of

diseases and clinical conditions associated with TAPBP. The function of TAPBP has been established by previous studies. Newly assembled major histocompatibility complex (MHC) class I molecules (see OMIM Ref. No. 142800), together with the endoplasmic reticulum (ER) chaperone calreticulin (OMIM Ref. No. 109091), interact with the transporter associated with antigen processing (TAP1; 170260) through a molecule called tapasin (Sadasivan et al., 1996). By molecular cloning of tapasin, Ortmann et al. (1997) found it to be a type I transmembrane glycoprotein encoded by an MHC-linked gene. The mature protein has 428 amino acids with a single N-linked glycosylation site at position 233. It is a member of the immunoglobulin superfamily with a probable cytoplasmic ER retention signal. Up to 4 MHC class I/tapasin complexes were found to bind to each TAP molecule in Daudi and L001 cells. Expression of tapasin in a negative mutant human cell line restored class I/TAP association and normal class I cell surface expression. Tapasin expression also corrected the defective recognition of virus-infected cells of the same line by class I-restricted cytotoxic T cells, thus establishing a critical functional role for tapasin in MHC class I-restricted antigen processing. Herberg et al. (1998) iden-

tified an EST encoding the mouse tapasin homolog. Mayer and Klein (2001) proposed that tapasin is in reality an MHC class I molecule with a different function from that currently executed by conventional class I molecules. They based this proposal on the amino acid sequence similarity between tapasin and conventional class I molecules, on similarity of predicted tertiary structure and domain organization of the molecules, on similarity of exon/intron organization of the encoding genes, and on the mapping of the class IA and tapasin genes into the same chromosomal region in all jawed vertebrates that had been tested to that time (Michalova et al., 2000).

[9803] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9804] Mayer, W. E.; Klein, J. : Is tapasin a modified Mhc class I molecule? Immunogenetics 53: 719–723, 2001. ; and

[9805] Ortmann, B.; Copeman, J.; Lehner, P. J.; Sadasivan, B.; Herberg, J. A.; Grandea, A. G.; Riddell, S. R.; Tampe, R.; Spies, T.; Trowsdale, J.; Cresswell, P. : A critical role for tapasin.

[9806] Further studies establishing the function and utilities of TAPBP are found in John Hopkins OMIM database record ID 601962, and in cited publications numbered

5822–5828 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 5 (double-strand-break rejoining; Ku autoantigen, 80kDa) (XRCC5, Accession NM_021141) is another VGAM122 host target gene. XRCC5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XRCC5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XRCC5 BINDING SITE, designated SEQ ID:22114, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9807] Another function of VGAM122 is therefore inhibition of X-ray Repair Complementing Defective Repair In Chinese Hamster Cells 5 (double-strand-break rejoining; Ku autoantigen, 80kDa) (XRCC5, Accession NM_021141), a gene which is one subunit of the Ku protein complex, which binds to DNA ends and regulates DNA-dependent protein kinase. Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XRCC5. The function of XRCC5 has

been established by previous studies. The human XRCC5 DNA repair gene complements the radiosensitive mutant xrs-6, derived from Chinese hamster ovary cells which are defective in DNA double-strand break repair and in ability to undergo V(D)J recombination. The XRCC5 gene encodes the 80-kD subunit of the Ku autoantigen, a heterodimer which contributes to genomic integrity through its ability to bind DNA double-strand breaks and facilitate repair by the nonhomologous end-joining pathway. Tuteja et al. (1994) purified from HeLa cells an enzyme they called DNA helicase II, an ATP-dependent DNA unwinding enzyme. They showed that it is a heterodimer of 72 and 87 kD polypeptides. Sequencing showed that it is identical to the Ku autoantigen. The exclusively nuclear location of this particular DNA helicase II/Ku antigen, its highly specific affinity for double-stranded DNA, its abundance, and its exclusive DNA-duplex unwinding activity pointed to additional roles for this molecule in DNA metabolism. Animal model experiments lend further support to the function of XRCC5. Difilippantonio et al. (2000) demonstrated that mouse cells deficient for Ku80 display a marked increase in chromosomal aberrations, including breakage, translocations, and aneuploidy. Despite the observed

chromosome instabilities, Ku80 $-/-$ mice have only a slightly earlier onset of cancer. Loss of p53 (OMIM Ref. No. 191170) synergizes with Ku80 to promote tumorigenesis such that all Ku80 $-/-$ /p53 $-/-$ mice succumb to disseminated pro-B-cell lymphoma before 3 months of age. Tumors result from a specific set of chromosomal translocations and gene amplifications involving IgH and c-Myc, reminiscent of Burkitt lymphoma (OMIM Ref. No. 113970). Difilippantonio et al. (2000) concluded that Ku80 is a caretaker gene that maintains the integrity of the genome by a mechanism involving suppression of chromosomal rearrangements.

[9808] It is appreciated that the abovementioned animal model for XRCC5 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9809] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9810] Difilippantonio, M. J.; Zhu, J.; Chen, H. T.; Meffre, E.; Nussenzweig, M. C.; Max, E. E.; Ried, T.; Nussenzweig, A. : DNA repair protein Ku80 suppresses chromosomal aberrations and malignant transformation. Nature 404:

510–514, 2000. ; and

[9812] Further studies establishing the function and utilities of XRCC5 are found in John Hopkins OMIM database record ID 194364, and in cited publications numbered 6048, 6051, 6054–6056, 183 and 6057–1840 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. HDAC9–PENDING (Accession NM_014707) is another VGAM122 host target gene. HDAC9–PENDING BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by HDAC9–PENDING, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HDAC9–PENDING BINDING SITE, designated SEQ ID:16250, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9813] Another function of VGAM122 is therefore inhibition of HDAC9–PENDING (Accession NM_014707). Accordingly,

utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HDAC9-PENDING. KIAA0121 (Accession XM_052386) is another VGAM122 host target gene. KIAA0121 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0121, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0121 BINDING SITE, designated SEQ ID:35967, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9814] Another function of VGAM122 is therefore inhibition of KIAA0121 (Accession XM_052386). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0121. KIAA0620 (Accession XM_030707) is another VGAM122 host target gene. KIAA0620 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0620, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of

KIAA0620 BINDING SITE, designated SEQ ID:31123, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9815] Another function of VGAM122 is therefore inhibition of KIAA0620 (Accession XM_030707). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0620. KIAA1550 (Accession XM_039393) is another VGAM122 host target gene. KIAA1550 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1550, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1550 BINDING SITE, designated SEQ ID:33073, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9816] Another function of VGAM122 is therefore inhibition of KIAA1550 (Accession XM_039393). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1550. PRO0461 (Accession NM_031268) is another VGAM122 host target gene. PRO0461 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO0461, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO0461 BINDING SITE, designated SEQ ID:25285, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9817] Another function of VGAM122 is therefore inhibition of PRO0461 (Accession NM_031268). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO0461. LOC118738 (Accession XM_061125) is another VGAM122 host target gene. LOC118738 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC118738, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC118738 BINDING SITE, designated SEQ ID:37193, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9818] Another function of VGAM122 is therefore inhibition of

LOC118738 (Accession XM_061125). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC118738. LOC203536 (Accession XM_114716) is another VGAM122 host target gene. LOC203536 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203536, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203536 BINDING SITE, designated SEQ ID:43055, to the nucleotide sequence of VGAM122 RNA, herein designated VGAM RNA, also designated SEQ ID:2833.

[9819] Another function of VGAM122 is therefore inhibition of LOC203536 (Accession XM_114716). Accordingly, utilities of VGAM122 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203536. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 123 (VGAM123) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is

known in the art.

[9820] VGAM123 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM123 was detected is described hereinabove with reference to Figs. 1–8.

[9821] VGAM123 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9822] VGAM123 gene encodes a VGAM123 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM123 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM123 precursor RNA is designated SEQ ID:109, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:109 is located at position 246206 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9823] VGAM123 precursor RNA folds onto itself, forming VGAM123 folded precursor RNA, herein designated VGAM

FOLDED PRECURSOR RNA, which has a two-dimensional
`hairpin structure`. As is well known in the art, this
`hairpin structure`, is typical of RNA encoded by miRNA
genes, and is due to the fact that the nucleotide sequence
of the first half of the RNA encoded by a miRNA gene is an
accurate or partial inversed-reversed sequence of the nu-
cleotide sequence of the second half thereof.

[9824] An enzyme complex designated DICER COMPLEX, `dices`
the VGAM123 folded precursor RNA into VGAM123 RNA,
herein designated VGAM RNA, a single stranded ~22 nt
long RNA segment. As is known in the art, `dicing` of a
hairpin structured RNA precursor product into a short
~22nt RNA segment is catalyzed by an enzyme complex
comprising an enzyme called Dicer together with other
necessary proteins. A probable (over 43%) nucleotide se-
quence of VGAM123 RNA is designated SEQ ID:2834, and
is provided hereinbelow with reference to the sequence
listing part.

[9825] VGAM123 host target gene, herein designated VGAM
HOST TARGET GENE, encodes a corresponding messenger
RNA, VGAM123 host target RNA, herein designated VGAM
HOST TARGET RNA. VGAM123 host target RNA comprises
three regions, as is typical of mRNA of a protein coding

gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9826] VGAM123 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM123 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM123 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in

the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9827] The complementary binding of VGAM123 RNA, herein designated VGAM RNA, to host target binding sites on VGAM123 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM123 host target RNA into VGAM123 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9828] It is appreciated that VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM123 host target genes. The mRNA of each one of this plurality of VGAM123 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM123 RNA, herein designated VGAM RNA, and which when bound by VGAM123 RNA causes inhibition of translation of respective one or more VGAM123 host target proteins.

[9829] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by

VGAM123 gene, herein designated VGAM GENE, on one or more VGAM123 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9830] It is yet further appreciated that a function of VGAM123 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM123 correlate with, and may be deduced from, the identity of the host target genes which VGAM123 binds and inhibits, and the

function of these host target genes, as elaborated herein–below.

[9831] Nucleotide sequences of the VGAM123 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM123 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM123 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM123 are further described hereinbelow with reference to Table 1.

[9832] Nucleotide sequences of host target binding sites, such as BINDING SITE–I, BINDING SITE–II and BINDING SITE–III of Fig. 1, found on VGAM123 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM123 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9833] As mentioned hereinabove with reference to Fig. 1, a function of VGAM123 gene, herein designated VGAM is inhibition of expression of VGAM123 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM123 correlate with, and may be deduced from, the identity of the target genes which VGAM123 binds and inhibits, and the function of these target genes,

as elaborated hereinbelow.

[9834] Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162) is a VGAM123 host target gene. NFATC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NFATC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NFATC1 BINDING SITE, designated SEQ ID:12813, to the nucleotide sequence of VGAM123 RNA, herein designated VGAM RNA, also designated SEQ ID:2834.

[9835] A function of VGAM123 is therefore inhibition of Nuclear Factor of Activated T-cells, Cytoplasmic, Calcineurin-dependent 1 (NFATC1, Accession NM_006162), a gene which regulates the activation, proliferation, differentiation and programmed death of lymphoid and nonlymphoid cells. Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NFATC1. The function of NFATC1 has been established by previous studies. Jauliac et al. (2002) found that both NFATC1 and NFAT5 (OMIM Ref. No. 604708) were expressed in invasive human ductal breast

carcinomas. Using cell lines derived from breast and colon carcinomas, they found that these NFATs promoted carcinoma invasion and that their activity correlated with expression of alpha-6 (OMIM Ref. No. 147556)/beta-4 (OMIM Ref. No. 147557) integrin. Animal model experiments lend further support to the function of NFATC1. Whereas *Nfatc1*-deficient mice have impaired proliferative and Th2-like responses, *Nfatc2*-deficient mice have modestly enhanced responses with Th2-like characteristics. By fetal liver chimerization in *Rag2* (OMIM Ref. No. 179616)-deficient hosts, Peng et al. (2001) generated mice whose lymphocytes were deficient in both transcription factors. Functional analysis showed that the double knockout (DKO) mice had reasonable proliferative responses and expression of activation markers but were incapable of producing a wide range of cytokines, with the exception of weak production of IL5 (OMIM Ref. No. 147850), and of expressing CD40 ligand (CD40LG; 300386) and CD95 ligand (CD95L; 134638) or allogeneic cytotoxicity. Analysis of serum immunoglobulins revealed significantly elevated amounts of IgG1 and IgE, isotypes typically associated with Th2-like immune responses, in DKO mice. The results suggested that NFATC1 and

NFATC2 are essential for the maintenance of B-cell homeostasis and differentiation, but are dispensable for T-cell inflammatory activity, as measured by lymphoproliferation and activation marker expression

[9836] It is appreciated that the abovementioned animal model for NFATC1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9837] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9838] Peng, S. L.; Gerth, A. J.; Ranger, A. M.; Glimcher, L. H. : NFATc1 and NFATc2 together control both T and B cell activation and differentiation. *Immunity* 14: 13–20, 2001.
; and

[9839] Jauliac, S.; Lopez-Rodriguez, C.; Shaw, L. M.; Brown, L. F.; Rao, A.; Toker, A. : The role of NFAT transcription factors in integrin-mediated carcinoma invasion. *Nature Cell Biol.* 4: 540–5.

[9840] Further studies establishing the function and utilities of NFATC1 are found in John Hopkins OMIM database record ID 600489, and in cited publications numbered 9903–9908, 11673–991 and 11674 listed in the bibliog–

raphy section hereinbelow, which are also hereby incorporated by reference. Nidogen (enactin) (NID, Accession NM_002508) is another VGAM123 host target gene. NID BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by NID, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NID BINDING SITE, designated SEQ ID:8338, to the nucleotide sequence of VGAM123 RNA, herein designated VGAM RNA, also designated SEQ ID:2834.

[9841] Another function of VGAM123 is therefore inhibition of Nidogen (enactin) (NID, Accession NM_002508). Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NID. Solute Carrier Family 19, Member 3 (SLC19A3, Accession NM_025243) is another VGAM123 host target gene. SLC19A3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC19A3, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC19A3 BINDING SITE,

designated SEQ ID:24924, to the nucleotide sequence of VGAM123 RNA, herein designated VGAM RNA, also designated SEQ ID:2834.

[9842] Another function of VGAM123 is therefore inhibition of Solute Carrier Family 19, Member 3 (SLC19A3, Accession NM_025243). Accordingly, utilities of VGAM123 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC19A3. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 124 (VGAM124) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9843] VGAM124 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM124 was detected is described hereinabove with reference to Figs. 1–8.

[9844] VGAM124 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9845] VGAM124 gene encodes a VGAM124 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM124 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM124 precursor RNA is designated SEQ ID:110, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:110 is located at position 232082 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9846] VGAM124 precursor RNA folds onto itself, forming VGAM124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9847] An enzyme complex designated DICER COMPLEX, `dices` the VGAM124 folded precursor RNA into VGAM124 RNA, herein designated VGAM RNA, a single stranded ~22 nt

long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM124 RNA is designated SEQ ID:2835, and is provided hereinbelow with reference to the sequence listing part.

[9848] VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM124 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9849] VGAM124 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM124 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide se-

quence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM124 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9850] The complementary binding of VGAM124 RNA, herein designated VGAM RNA, to host target binding sites on VGAM124 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM124 host target RNA into VGAM124 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9851] It is appreciated that VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM124 host target genes. The mRNA of each one of this plurality of VGAM124 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM124 RNA, herein designated VGAM RNA, and which when bound by VGAM124 RNA causes inhibition of translation of respective one or more VGAM124 host target proteins.

[9852] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM124 gene, herein designated VGAM GENE, on one or more VGAM124 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, al-

though specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9853] It is yet further appreciated that a function of VGAM124 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM124 correlate with, and may be deduced from, the identity of the host target genes which VGAM124 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9854] Nucleotide sequences of the VGAM124 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM124 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM124 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM124 are further described hereinbelow with reference to Table 1.

[9855] Nucleotide sequences of host target binding sites, such as

BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM124 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM124 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9856] As mentioned hereinabove with reference to Fig. 1, a function of VGAM124 gene, herein designated VGAM is inhibition of expression of VGAM124 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM124 correlate with, and may be deduced from, the identity of the target genes which VGAM124 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9857] Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471) is a VGAM124 host target gene. GNPI BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GNPI, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GNPI BINDING SITE, designated SEQ ID:11965, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM

RNA, also designated SEQ ID:2835.

[9858] A function of VGAM124 is therefore inhibition of Glucosamine-6-phosphate Isomerase (GNPI, Accession NM_005471), a gene which converts glucosamine-6-phosphate to fructose-6-phosphate. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GNPI. The function of GNPI has been established by previous studies. In the course of investigating hexosamine catabolism in the human malaria parasite, *Plasmodium falciparum*, Weidanz et al. (1995) became aware of deficiencies in understanding the relevant enzymatic reactions in the host erythrocyte. For that reason, they undertook studies of human glucosamine 6-phosphate deaminase using a newly developed sensitive radiometric assay. They characterized biochemically the erythrocyte enzyme and reported data on its kinetics, temperature stability, and chromatographic purification. Weidanz et al. (1995) noted that the nucleotide sequence of the nagB gene, encoding the deaminase in *E. coli* K12, has been determined (Rogers et al. (1988)) but information about the primary structure of the mammalian enzyme was not available. The hamster sperm oscillin protein is responsible for

oocyte calcium oscillations. By screening a testis cDNA library for a homolog of hamster oscillin, Shevchenko et al. (1998) obtained a cDNA encoding GNPI. The deduced 289-amino acid protein is 96% identical to the hamster sequence. SDS-PAGE and Western blot analysis indicated that GNPI is expressed as a 33-kD cytosolic protein in various cell lines. Functional analysis showed that GNPI has glucosamine 6-phosphate deaminase activity but does not induce calcium oscillations in mammalian eggs. Genomic sequence analysis determined that the single-copy GNPI gene contains 8 exons.

[9859] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9860] Shevchenko, V.; Hogben, M.; Ekong, R.; Parrington, J.; Lai, F. A. : The human glucosamine-6-phosphate deaminase gene: cDNA cloning and expression, genomic organization and chromosomal localization. *Gene* 216: 31-38, 1998. ; and

[9861] Weidanz, J. A.; Campbell, P.; DeLucas, L. J.; Jin, J.; Moore, D.; Roden, L.; Yu, H.; Heilmann, E.; Vezza, A. C. : Glucosamine 6-phosphate deaminase in normal human erythrocytes. *Brit. J.*

[9862] Further studies establishing the function and utilities of GNPI are found in John Hopkins OMIM database record ID 601798, and in cited publications numbered 6244–6247 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. G Protein–coupled Receptor 65 (GPR65, Accession XM_007392) is another VGAM124 host target gene. GPR65 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by GPR65, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPR65 BINDING SITE, designated SEQ ID:30050, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9863] Another function of VGAM124 is therefore inhibition of G Protein–coupled Receptor 65 (GPR65, Accession XM_007392). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPR65. Mannose–binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242) is another VGAM124 host target gene. MBL2 BINDING SITE is HOST TARGET binding site

found in the 3' untranslated region of mRNA encoded by MBL2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MBL2 BINDING SITE, designated SEQ ID:5761, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9864] Another function of VGAM124 is therefore inhibition of Mannose-binding Lectin (protein C) 2, Soluble (opsonic defect) (MBL2, Accession NM_000242). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MBL2. Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655) is another VGAM124 host target gene. PLAG1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PLAG1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PLAG1 BINDING SITE, designated SEQ ID:8521, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9865] Another function of VGAM124 is therefore inhibition of

Pleiomorphic Adenoma Gene 1 (PLAG1, Accession NM_002655), a gene which contains a zinc finger domain. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PLAG1. The function of PLAG1 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM29. Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM_006922) is another VGAM124 host target gene. SCN3A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SCN3A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SCN3A BINDING SITE, designated SEQ ID:13796, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9866] Another function of VGAM124 is therefore inhibition of Sodium Channel, Voltage-gated, Type III, Alpha Polypeptide (SCN3A, Accession NM_006922), a gene which may be important for maintaining neural membrane excitabil-

ity. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SCN3A. The function of SCN3A has been established by previous studies. On physical mapping by pulsed field gel electrophoresis in the mouse, Malo et al. (1991) demonstrated that the Scn2a (OMIM Ref. No. 182390) and Scn3a genes encoding type II and type III sodium channel alpha-subunit isoforms, respectively, are physically linked and are separated by a maximum distance of 600 kb. The gene for type II maps to chromosome 2 in both mouse and man; hence, SCN3A in the human must be located on chromosome 2. Ahmed et al. (1992) isolated 2 cDNAs from a human cerebral cortex library by screening for the presence of sodium channel alpha-subunit-specific clones. One of the clones showed greatest homology to rat brain sodium channel II. The second clone encoded a different subtype sodium channel, probably a type III channel. Both of the genes were mapped to human chromosome 2 by study of human-hamster somatic cell hybrids; PCR with primers derived from the second cDNA was used for localizing the gene, which presumably was SCN3A. By in situ hybridization, both of the genes mapped to 2q23-q24.3. Malo et al.

(1994) mapped the SCN3A gene to chromosome 2 with 100% concordance using PCR on human/rodent somatic cell hybrid panels. By fluorescence in situ hybridization, they mapped the gene to 2q24–q31.

[9867] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9868] Malo, D.; Schurr, E.; Dorfman, J.; Canfield, V.; Levenson, R.; Gros, P. : Three brain sodium channel alpha–subunit genes are clustered on the proximal segment of mouse chromosome 2. Genomics 10: 666–672, 1991. ; and

[9869] Malo, M. S.; Srivastava, K.; Andresen, J. M.; Chen, X.–N.; Korenberg, J. R.; Ingram, V. M. : Targeted gene walking by low stringency polymerase chain reaction: assignment of a putative.

[9870] Further studies establishing the function and utilities of SCN3A are found in John Hopkins OMIM database record ID 182391, and in cited publications numbered 75 and 885–886 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TEM7 (Accession NM_020405) is another VGAM124 host target gene. TEM7 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by

TEM7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TEM7 BINDING SITE, designated SEQ ID:21672, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9871] Another function of VGAM124 is therefore inhibition of TEM7 (Accession NM_020405), a gene which involves in angiogenesis. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TEM7. The function of TEM7 and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM23.Tryptase, Alpha (TPS1, Accession XM_018104) is another VGAM124 host target gene. TPS1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by TPS1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of TPS1 BINDING SITE, designated SEQ ID:30336, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA,

also designated SEQ ID:2835.

[9872] Another function of VGAM124 is therefore inhibition of Tryptase, Alpha (TPS1, Accession XM_018104), a gene which Alpha tryptase; mast cell-specific serine protease. Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TPS1. The function of TPS1 has been established by previous studies. Tryptase is a serine protease that is selectively concentrated in the secretory granules of mast cells and is secreted during the coupled activation-degranulation response of these cells. Its exclusive presence in mast cells permits its use as a specific clinical indicator of mast cell activation by measurement of its level in biologic fluids and as a selective marker of intact mast cells using immunohistochemical techniques with antitryptase antibodies. The enzyme is a tetramer with 4 subunits of 31,000–33,000 Da. Miller et al. (1989) cloned and sequenced human tryptase cDNA. Based on nucleic acid sequence, human tryptase consists of a 244-amino acid catalytic portion of 27,423 Da with 2 putative N-linked carbohydrate-binding sites and a 30-amino acid leader sequence of 3,048 Da. Vanderslice et al. (1990) demonstrated the existence of multiple

trypsinases. In this respect, mast cell trypsinase is like other serine proteases such as glandular kallikrein (OMIM Ref. No. 147960) and trypsin (OMIM Ref. No. 276000), which are also members of multigene families. Miller et al. (1990) mapped both alpha-trypsinase and beta-trypsinase (OMIM Ref. No. 191081) to human chromosome 16 by PCR analysis of DNA from human/hamster somatic cell hybrids.

[9873] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9874] Miller, J. S.; Westin, E. H.; Schwartz, L. B. : Cloning and characterization of complementary DNA for human trypsinase. J. Clin. Invest. 84: 1188–1195, 1989. ; and

[9875] Vanderslice, P.; Ballinger, S. M.; Tam, E. K.; Goldstein, S. M.; Craik, C. S.; Caughey, G. H. : Human mast cell trypsinase: multiple cDNAs and genes reveal a multigene serine protease fami.

[9876] Further studies establishing the function and utilities of TPS1 are found in John Hopkins OMIM database record ID 191080, and in cited publications numbered 9772–9774 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.CSR1 (Accession

NM_016240) is another VGAM124 host target gene. CSR1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CSR1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CSR1 BINDING SITE, designated SEQ ID:18355, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9877] Another function of VGAM124 is therefore inhibition of CSR1 (Accession NM_016240). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CSR1. DKFZP564F013 (Accession XM_168479) is another VGAM124 host target gene. DKFZP564F013 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZP564F013, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564F013 BINDING SITE, designated SEQ ID:45202, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9878] Another function of VGAM124 is therefore inhibition of DKFZP564F013 (Accession XM_168479). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564F013. FLJ13072 (Accession XM_117117) is another VGAM124 host target gene. FLJ13072 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by FLJ13072, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ13072 BINDING SITE, designated SEQ ID:43235, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9879] Another function of VGAM124 is therefore inhibition of FLJ13072 (Accession XM_117117). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ13072. KIAA1238 (Accession XM_048675) is another VGAM124 host target gene. KIAA1238 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1238, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or

BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1238 BINDING SITE, designated SEQ ID:35213, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9880] Another function of VGAM124 is therefore inhibition of KIAA1238 (Accession XM_048675). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1238. NYD-SP11 (Accession NM_031951) is another VGAM124 host target gene. NYD-SP11 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by NYD-SP11, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of NYD-SP11 BINDING SITE, designated SEQ ID:25690, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9881] Another function of VGAM124 is therefore inhibition of NYD-SP11 (Accession NM_031951). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with NYD-

SP11. RP4-622L5 (Accession NM_019118) is another VGAM124 host target gene. RP4-622L5 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by RP4-622L5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of RP4-622L5 BINDING SITE, designated SEQ ID:21199, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9882] Another function of VGAM124 is therefore inhibition of RP4-622L5 (Accession NM_019118). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with RP4-622L5. Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617) is another VGAM124 host target gene. SLC11A2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SLC11A2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SLC11A2 BINDING SITE, designated SEQ

ID:6221, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9883] Another function of VGAM124 is therefore inhibition of Solute Carrier Family 11 (proton-coupled divalent metal ion transporters), Member 2 (SLC11A2, Accession NM_000617). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SLC11A2. UQCR (Accession NM_006830) is another VGAM124 host target gene. UQCR BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by UQCR, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of UQCR BINDING SITE, designated SEQ ID:13709, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9884] Another function of VGAM124 is therefore inhibition of UQCR (Accession NM_006830). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with UQCR. LOC146958 (Accession XM_097142) is another VGAM124

host target gene. LOC146958 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC146958, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC146958 BINDING SITE, designated SEQ ID:40772, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9885] Another function of VGAM124 is therefore inhibition of LOC146958 (Accession XM_097142). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146958. LOC147004 (Accession XM_097155) is another VGAM124 host target gene. LOC147004 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC147004, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC147004 BINDING SITE, designated SEQ ID:40780, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9886] Another function of VGAM124 is therefore inhibition of LOC147004 (Accession XM_097155). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC147004. LOC153592 (Accession XM_098396) is another VGAM124 host target gene. LOC153592 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC153592, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC153592 BINDING SITE, designated SEQ ID:41648, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9887] Another function of VGAM124 is therefore inhibition of LOC153592 (Accession XM_098396). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC153592. LOC220776 (Accession XM_043388) is another VGAM124 host target gene. LOC220776 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220776, corresponding to a HOST TARGET binding site such as BIND-

ING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220776 BINDING SITE, designated SEQ ID:33929, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9888] Another function of VGAM124 is therefore inhibition of LOC220776 (Accession XM_043388). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC220776. LOC220827 (Accession XM_166052) is another VGAM124 host target gene. LOC220827 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC220827, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC220827 BINDING SITE, designated SEQ ID:43845, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9889] Another function of VGAM124 is therefore inhibition of LOC220827 (Accession XM_166052). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC220827. LOC221814 (Accession XM_168226) is another VGAM124 host target gene. LOC221814 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221814, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221814 BINDING SITE, designated SEQ ID:45096, to the nucleotide sequence of VGAM124 RNA, herein designated VGAM RNA, also designated SEQ ID:2835.

[9890] Another function of VGAM124 is therefore inhibition of LOC221814 (Accession XM_168226). Accordingly, utilities of VGAM124 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221814. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 125 (VGAM125) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9891] VGAM125 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The

method by which VGAM125 was detected is described hereinabove with reference to Figs. 1–8.

[9892] VGAM125 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9893] VGAM125 gene encodes a VGAM125 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM125 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM125 precursor RNA is designated SEQ ID:111, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:111 is located at position 36670 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9894] VGAM125 precursor RNA folds onto itself, forming VGAM125 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA

genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9895] An enzyme complex designated DICER COMPLEX, `dices` the VGAM125 folded precursor RNA into VGAM125 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM125 RNA is designated SEQ ID:2836, and is provided hereinbelow with reference to the sequence listing part.

[9896] VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM125 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9897] VGAM125 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM125 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM125 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[9898] The complementary binding of VGAM125 RNA, herein

designated VGAM RNA, to host target binding sites on VGAM125 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM125 host target RNA into VGAM125 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9899] It is appreciated that VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM125 host target genes. The mRNA of each one of this plurality of VGAM125 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM125 RNA, herein designated VGAM RNA, and which when bound by VGAM125 RNA causes inhibition of translation of respective one or more VGAM125 host target proteins.

[9900] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM125 gene, herein designated VGAM GENE, on one or more VGAM125 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other

known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9901] It is yet further appreciated that a function of VGAM125 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM125 correlate with, and may be deduced from, the identity of the host target genes which VGAM125 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9902] Nucleotide sequences of the VGAM125 precursor RNA,

herein designated VGAM PRECURSOR RNA, and of the
`diced` VGAM125 RNA, herein designated VGAM RNA,
and a schematic representation of the secondary folding
of VGAM125 folded precursor RNA, herein designated
VGAM FOLDED PRECURSOR RNA, of VGAM125 are further
described hereinbelow with reference to Table 1.

[9903] Nucleotide sequences of host target binding sites, such as
BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of
Fig. 1, found on VGAM125 host target RNA, and schematic
representation of the complementarity of each of these
host target binding sites to VGAM125 RNA, herein desig-
nated VGAM RNA, are described hereinbelow with refer-
ence to Table 2.

[9904] As mentioned hereinabove with reference to Fig. 1, a
function of VGAM125 gene, herein designated VGAM is
inhibition of expression of VGAM125 target genes. It is
appreciated that specific functions, and accordingly utili-
ties, of VGAM125 correlate with, and may be deduced
from, the identity of the target genes which VGAM125
binds and inhibits, and the function of these target genes,
as elaborated hereinbelow.

[9905] Endometrial Bleeding Associated Factor (left-right deter-
mination, factor A; transforming growth factor beta su-

perfamily) (EBAF, Accession XM_037302) is a VGAM125 host target gene. EBAF BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by EBAF, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of EBAF BINDING SITE, designated SEQ ID:32608, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9906] A function of VGAM125 is therefore inhibition of Endometrial Bleeding Associated Factor (left-right determination, factor A; transforming growth factor beta superfamily) (EBAF, Accession XM_037302), a gene which LEFT-RIGHT AXIS MALFORMATIONS. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with EBAF. The function of EBAF and its association with various diseases and clinical conditions, has been established by previous studies, as described hereinabove with reference to VGAM93. Glypican 1 (GPC1, Accession NM_002081) is another VGAM125 host target gene. GPC1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated

region of mRNA encoded by GPC1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GPC1 BINDING SITE, designated SEQ ID:7874, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9907] Another function of VGAM125 is therefore inhibition of Glypican 1 (GPC1, Accession NM_002081), a gene which may play a role in growth control and differentiation. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GPC1. The function of GPC1 has been established by previous studies. Cell surface heparan sulfate proteoglycans are composed of a membrane-associated protein core substituted with a variable number of heparan sulfate chains. Two different cell surface heparan sulfate proteoglycan families can be distinguished: (1) the syndecan-like integral membrane proteoglycans (SLIPS), with a core protein spanning the cytoplasmic membrane, and (2) the glypican-related integral membrane proteoglycans (GRIPS), with a core protein anchored to the cytoplasmic membrane via a glycosyl phosphatidylinositol.

Vermeesch et al. (1995) mapped the gene encoding glypican, the only human glypiated heparan sulfate proteoglycan that had so far been identified by cloning. By fluorescence in situ hybridization, they assigned the gene to 2q35–q37. Endostatin (OMIM Ref. No. 120328), a collagen XVIII fragment, is a potent antiangiogenic protein. Karumanchi et al. (2001) showed that alkaline phosphatase-tagged endostatin bound endothelial cells, revealing 2 binding affinities. Expression cloning identified glypican, specifically glypican–1 or glypican–4 (OMIM Ref. No. 300168), as the lower-affinity receptor. Biochemical and genetic studies indicated that the heparan sulfate glycosaminoglycans of glypican were critical for endostatin binding. Furthermore, endostatin selected a specific octasulfated hexasaccharide from a sequence in heparin. Karumanchi et al. (2001) also demonstrated a role for endostatin in renal tubular cell branching morphogenesis and showed that glypicans serve as low-affinity receptors for endostatin in these cells, as in endothelial cells. Anti-sense experiments suggested the critical importance of glypicans in mediating endostatin activities.

[9908] Full details of the abovementioned studies are described in the following publications, the disclosure of which are

hereby incorporated by reference:

- [9909] Karumanchi, S. A.; Jha, V.; Ramchandran, R.; Karihaloo, A.; Tsiokas, L.; Chan, B.; Dhanabal, M.; Hanai, J.; Venkataraman, G.; Shriver, Z.; Keiser, N.; Kalluri, R.; and 9 others : Cell surface glypicans are low-affinity endostatin receptors. *Molec. Cell* 7: 811–822, 2001. ; and
- [9910] Vermeesch, J. R.; Mertens, G.; David, G.; Marynen, P. : Assignment of the human glypican gene (GPC1) to 2q35–q37 by fluorescence in situ hybridization. *Genomics* 25: 327–329, 1995.
- [9911] Further studies establishing the function and utilities of GPC1 are found in John Hopkins OMIM database record ID 600395, and in cited publications numbered 7251 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2A (GRIN2A, Accession NM_000833) is another VGAM125 host target gene. GRIN2A BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GRIN2A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GRIN2A BINDING SITE, designated SEQ

ID:6488, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9912] Another function of VGAM125 is therefore inhibition of Glutamate Receptor, Ionotropic, N-methyl D-aspartate 2A (GRIN2A, Accession NM_000833), a gene which modulates the efficiency of synaptic plasticity. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GRIN2A. The function of GRIN2A has been established by previous studies. Molecular cloning and expression of cDNAs demonstrate that the epsilon and zeta subfamilies of the mouse glutamate receptor channel subunits constitute NMDA (N-methyl-D-aspartate) receptor channels (see OMIM Ref. No. GRIN2D; 602717). Four members of the epsilon subfamily, the E1, E2 (GRIN2B; 138252), E3 (GRIN2C; 138254), and E4 (OMIM Ref. No. GRIN2D) subunits, are distinct in distribution, functional properties, and regulation. Thus, the molecular diversity of the epsilon subunit family probably underlies the functional heterogeneity of the NMDA receptor channel. Rat counterparts of the mouse E1, E2, E3, E4, and zeta-1 (Z1; GRIN1, 138249) subunits were also isolated and designated as

Nr2a, Nr2b, Nr2c, Nr2d, and Nmdar1, respectively (Monyer et al., 1992; Ishii et al., 1993). Animal model experiments lend further support to the function of GRIN2A. Sakimura et al. (1995) showed that targeted disruption of the mouse Nmdar2a gene produced mice that were viable, although impaired hippocampal plasticity was observed in homozygous $-/-$ mice. By gene targeting, Sprengel et al. (1998) generated mutant mice expressing the Nmdar2a gene without the large intracellular C-terminal domain. These mice were viable but exhibited impaired synaptic plasticity and contextual memory. The authors concluded that the observed phenotypes appear to reflect defective intracellular signaling.

[9913] It is appreciated that the abovementioned animal model for GRIN2A is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9914] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9915] Monyer, H.; Sprengel, R.; Schoepfer, R.; Herb, A.; Higuchi, M.; Lomeli, H.; Burnashev, N.; Sakmann, B.; Seeburg, P. H. : Heteromeric NMDA receptors: molecular and functional

distinction of subtypes. Science 256: 1217–1221, 1992. ;
and

[9916] Sakimura, K.; Kutsuwada, T.; Ito, I.; Manabe, T.; Takayama, C.; Kushiya, E.; Yagi, T.; Aizawa, S.; Inoue, Y.; Sugiyama, H.; Mishina, M. : Reduced hippocampal LTP and spatial learning in.

[9917] Further studies establishing the function and utilities of GRIN2A are found in John Hopkins OMIM database record ID 138253, and in cited publications numbered 3598, 1457–1460, 145 and 3599 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140) is another VGAM125 host target gene. HNRPK BINDING SITE1 and HNRPK BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by HNRPK, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPK BINDING SITE1 and HNRPK BINDING SITE2, designated SEQ ID:7915 and SEQ ID:25279 respectively, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9918] Another function of VGAM125 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein K (HNRPK, Accession NM_002140), a gene which play a role in the nuclear metabolism of hnRNAs, particularly for pre-mRNAs that contain cytidine-rich sequence. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPK. The function of HNRPK has been established by previous studies. The hnRNP-K family of acidic nuclear proteins have been identified using a monoclonal antibody that distinguishes between quiescent and proliferating human keratinocytes. The family, which is composed of at least 4 major proteins (e.g.: 164017, 600124, 164020, and HNRPD) and their modified forms, is present in similar overall levels in quiescent and proliferating normal keratinocytes, although clear differences were observed in levels of some of the individual variants. Using a monoclonal antibody as a probe, Dejgaard et al. (1994) cloned a cDNA coding for type B hnRNP-K, and this was used to screen for additional family members. Sequencing of positive clones revealed 4 alternative splicing variants of a gene that mapped to chromosome 9 (by Southern blot analysis of human/rodent somatic cell hybrids). The hnRNP-K protein

has been implicated in pre-mRNA metabolism of transcripts containing cytidine-rich sequences, and the results of Dejgaard et al. (1994) point toward a role in cell cycle progression. Tommerup and Leffers (1996) mapped HNRNPK to 9q21.32-q21.33 by fluorescence in situ hybridization.

- [9919] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9920] Dejgaard, K.; Leffers, H.; Rasmussen, H. H.; Madsen, P.; Kruse, T. A.; Gesser, B.; Nielsen, H.; Celis, J. E. : Identification, molecular cloning, expression and chromosome mapping of a family of transformation upregulated hnRNP-K proteins derived by alternative splicing. J. Molec. Biol. 236: 33-48, 1994. ; and
- [9921] Tommerup, N.; Leffers, H. : Assignment of human KH-box-containing genes by in situ hybridization: HNRNPK maps to 9q21.32-q21.33, PCBP1 to 2p12-p13, and PCBP2 to 12q13.12-q13.13, distal to F.
- [9922] Further studies establishing the function and utilities of HNRNPK are found in John Hopkins OMIM database record ID 600712, and in cited publications numbered 10049-10050 listed in the bibliography section hereinbe-

low, which are also hereby incorporated by reference. MAX Binding Protein (MNT, Accession NM_020310) is another VGAM125 host target gene. MNT BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MNT, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MNT BINDING SITE, designated SEQ ID:21564, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9923] Another function of VGAM125 is therefore inhibition of MAX Binding Protein (MNT, Accession NM_020310). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MNT. Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350) is another VGAM125 host target gene. PDGFRB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PDGFRB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PDGFRB

BINDING SITE, designated SEQ ID:32815, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9924] Another function of VGAM125 is therefore inhibition of Platelet-derived Growth Factor Receptor, Beta Polypeptide (PDGFRB, Accession XM_038350), a gene which Platelet-derived growth factor receptor beta chain; tyrosine kinase receptor. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PDGFRB. The function of PDGFRB has been established by previous studies. Steer and Cross (2002) reviewed the acquired reciprocal chromosomal translocations that involve 5q31-q33 and are associated with a significant minority of patients with BCR-ABL-negative chronic myeloid leukemias. The most common of these fuses the ETV6 gene to the PDGFRB gene, but at the time of the review 4 additional partner genes were known: H4 (D10S170), HIP1, CEV14 (OMIM Ref. No. TRIP11), and rabaptin-5. Clinically, most patients present with a myeloproliferative disorder with eosinophilia, eosinophilic leukemia, or chronic myelomonocytic leukemia and thus fall into the broad category of myeloproliferative disorders/myelodysplastic

syndromes (MPD/MDS). With the advent of targeted signal transduction therapy, patients with rearrangement of PDGFRB might be better classified as a distinct subgroup of MPD/MDS. Animal model experiments lend further support to the function of PDGFRB. Klinghoffer et al. (2001) created 2 complementary lines of knockin mice in which the intracellular signaling domains of one PDGFR had been removed and replaced by those of the other PDGFR. While both lines demonstrated substantial rescue of normal development, substitution of the *Pdgfrb* signaling domains with those of *Pdgfra* resulted in varying degrees of vascular disease.

[9925] It is appreciated that the abovementioned animal model for PDGFRB is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[9926] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9927] Klinghoffer, R. A.; Mueting-Nelsen, P. F.; Faerman, A.; Shani, M.; Soriano, P. : The two PDGF receptors maintain conserved signaling in vivo despite divergent embryological functions. *Molec. Cell* 7: 343–354, 2001. ; and

- [9928] Steer, E. J.; Cross, N. C. P. : Myeloproliferative disorders with translocations of chromosome 5q31–35: role of the platelet–derived growth factor receptor beta. *Acta Haemat.* 107: 113–.
- [9929] Further studies establishing the function and utilities of PDGFRB are found in John Hopkins OMIM database record ID 173410, and in cited publications numbered 3526, 4606–3529, 11281, 5108–3535, 3822–353 and 3826 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Phosphatidylinositol Glycan, Class K (PIGK, Accession XM_039644) is another VGAM125 host target gene. PIGK BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by PIGK, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PIGK BINDING SITE, designated SEQ ID:33135, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.
- [9930] Another function of VGAM125 is therefore inhibition of Phosphatidylinositol Glycan, Class K (PIGK, Accession XM_039644), a gene which catalyzes the transfer of fully

assembled GPI units to proteins. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PIGK. The function of PIGK has been established by previous studies. Glycosylphosphatidylinositol (GPI) anchors are synthesized in the endoplasmic reticulum and posttranslationally added to N-terminally processed proteins, replacing C-terminal sequences at a specific upstream omega site. This final step consists of a transamidation reaction. By searching an EST database for sequences similar to yeast Gpi8, Benghezal et al. (1996) identified a cDNA encoding PIGK, which they called GPI8. Sequence analysis predicted that the 396-amino acid PIGK protein shares 43% amino acid identity with yeast Gpi8. Yu et al. (1997) identified a mutant cell line that fails to incorporate GPI anchors into nascent N-terminally processed proproteins due to a defect in transamidation. By PCR analysis using the PIGK sequence reported by Benghezal et al. (1996), Yu et al. (1997) identified additional upstream sequences, including an ATG initiation codon. Expression of this PIGK cDNA in the mutant cell line restored GPI anchor assembly. Northern blot analysis detected major 1.6- and 1.9-kb PIGK transcripts in HeLa and K562 cell lines. Southern blot

analysis of genomic DNA indicated that PIGK is a single gene spanning 20 to 25 kb. By somatic cell hybrid analysis, Yu et al. (1997) mapped the PIGK gene to chromosome 1.

[9931] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9932] Benghezal, M.; Benachour, A.; Rusconi, S.; Aebi, M.; Conzelmann, A. : Yeast Gpi8p is essential for GPI anchor attachment onto proteins. EMBO J. 15: 6575–6583, 1996. ; and

[9933] Yu, J.; Nagarajan, S.; Knez, J. J.; Udenfriend, S.; Chen, R.; Medof, M. E. : The affected gene underlying the class K glycosylphosphatidylinositol (GPI) surface protein defect codes for.

[9934] Further studies establishing the function and utilities of PIGK are found in John Hopkins OMIM database record ID 605087, and in cited publications numbered 6605–6606 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Prostaglandin F2 Receptor Negative Regulator (PTGFRN, Accession XM_040709) is another VGAM125 host target gene. PT-GFRN BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by PTGFRN, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PTGFRN BINDING SITE, designated SEQ ID:33365, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9935] Another function of VGAM125 is therefore inhibition of Prostaglandin F₂ Receptor Negative Regulator (PTGFRN, Accession XM_040709), a gene which inhibits the binding of prostaglandin f₂-alpha (pgf₂- alpha) to its specific fp receptor. Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PTGFRN. The function of PTGFRN has been established by previous studies. Orlicky et al. (1996) isolated a protein that copurifies with bovine prostaglandin F-2-alpha receptor (FP) and cloned the corresponding rat cDNA. Transfection experiments suggested that this protein inhibits binding of PGF-2-alpha to FP. Histologically, this protein (called FP regulatory protein, or FPRP, by them) shows a distribution coinciding well with those cells and tissues that respond to PGF-2-alpha.

- [9936] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9937] Nagase, T.; Kikuno, R.; Ishikawa, K.; Hirosawa, M.; Ohara, O. : Prediction of the coding sequences of unidentified human genes. XVI. The complete sequences of 150 new cDNA clones from brain which code for large proteins in vitro. DNA Res. 7: 65–73, 2000. ; and
- [9938] Stipp et al. (2001) used moderately stringent Brij96/97 detergent extraction to show that FPRP associates specifically with CD81 and CD9 but not with other tetraspanin molecules, such as C.
- [9939] Further studies establishing the function and utilities of PTGFRN are found in John Hopkins OMIM database record ID 601204, and in cited publications numbered 6370–6373 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. TR2 (Accession XM_051264) is another VGAM125 host target gene. TR2 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by TR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide se–

quences of TR2 BINDING SITE, designated SEQ ID:35795, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9940] Another function of VGAM125 is therefore inhibition of TR2 (Accession XM_051264), a gene which maintains high levels of reduced glutathione in the cytosol (by similarity). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with TR2. The function of TR2 has been established by previous studies. Members of the tumor necrosis factor receptor (TNFR) family play a key role in regulating the immune response to infection (see OMIM Ref. No. TNFR1, 191190). By screening for genes that mediate the entry of herpes simplex virus (HSV) into Chinese hamster ovary (CHO) cells, Montgomery et al. (1996) identified cDNAs encoding a member of the TNFR family. They designated the gene HVEM (herpesvirus entry mediator). The predicted 283-amino acid protein had characteristics of a type I membrane glycoprotein, with an N-terminal signal peptide, 2 potential sites for addition of N-linked glycans, and a putative membrane-spanning domain. Sequence analysis revealed that HVEM contained a cysteine-rich repeat region characteristic of TNFR family members, and

shared 17 to 25% amino acid identity with other TNFRs. Montgomery et al. (1996) suggested that HVEM plays an important role in HSV pathogenesis because it enhanced the entry of several wildtype HSV strains of both serotypes into CHO cells, and mediated HSV entry into activated human T cells. Independently, Kwon et al. (1997) cloned cDNAs encoding HVEM, which they designated TR2. Northern blot analysis revealed that HVEM is expressed as a 1.7-kb mRNA in several tissues, with the highest expression in lung, spleen, and thymus. Several additional larger mRNAs were observed in some tissues and several of the cDNAs contained insertions in the coding region, leading Kwon et al. (1997) to suggest that HVEM is regulated at the level of mRNA maturation. These authors reported that the in vitro translation product was 32 kD by SDS-PAGE. Marsters et al. (1997) also identified HVEM as a novel member of the TNFR family. The authors attributed differences between their predicted amino acid sequence and that of Montgomery et al. (1996) to polymorphism. Using epitope-tagged HVEM, Marsters et al. (1997) found that HVEM interacted in vivo with several TNFR-associated factor (TRAF) proteins, including TRAF1 (OMIM Ref. No. 601711), TRAF2 (OMIM Ref. No. 601895), TRAF3 (OMIM Ref. No.

601896), and TRAF5 (OMIM Ref. No. 602356). Expression of HVEM activated JNK1 (OMIM Ref. No. 601158), NF- κ -B (see OMIM Ref. No. 164011), and AP1 (OMIM Ref. No. 165160), which control expression of multiple genes in response to infection or cellular stress. Marsters et al. (1997) concluded that HVEM is linked via TRAFs to signal transduction pathways that activate the immune response. Hsu et al. (1997) cloned cDNAs for the mouse HVEM homolog, which they designated ATAR (another TRAF-associated receptor). The predicted 276-amino acid mouse protein shares only 45% protein sequence identity with human HVEM. By flow cytometric and RT-PCR analysis, Morel et al. (2000) showed that the expression of the HVEM ligand, LIGHT (TNFSF14; 604520), is upregulated, whereas HVEM expression is downregulated, after T-cell activation, particularly CD8-positive T-cell activation. HSV infection requires binding of the viral envelope glycoprotein D (gD) to cell surface receptors. Carfi et al. (2001) reported the x-ray structures of a soluble, truncated ectodomain of gD both alone and in complex with the ectodomain of its cellular receptor, TNFRSF14, which they called HVEA. Two bound anions suggested possible binding sites for another gD receptor, a 3-O-sulfonated hep-

aran sulfate. The structures revealed a V-like immunoglobulin fold at the core of gD that is closely related to cellular adhesion molecules and flanked by large N- and C-terminal extensions. The receptor-binding segment of gD, an N-terminal hairpin, appeared conformationally flexible, suggesting that a conformational change accompanying binding might be part of the viral entry mechanism. By fluorescence in situ hybridization, Kwon et al. (1997) mapped the HVEM gene to 1p36.3–p36.2. This region also contains the TNFR genes CD30 (OMIM Ref. No. 153243), ILA (OMIM Ref. No. 602250), TXGP1L (OMIM Ref. No. 600315), and TNFR2 (OMIM Ref. No. 191191), suggesting that HVEM evolved through a localized gene duplication event.

[9941] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9944] Further studies establishing the function and utilities of TR2 are found in John Hopkins OMIM database record ID 602746, and in cited publications numbered 2402–2403, 2406–240 and 2407 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. BCL2–associated Athanogene 5 (BAG5, Accession NM_004873) is another VGAM125 host target gene. BAG5 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by BAG5, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BAG5 BINDING SITE, designated SEQ ID:11307, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9945] Another function of VGAM125 is therefore inhibition of BCL2–associated Athanogene 5 (BAG5, Accession NM_004873). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BAG5. BM–002 (Accession NM_016617) is another VGAM125 host target gene. BM–002 BINDING SITE is HOST TARGET binding site found in

the 3' untranslated region of mRNA encoded by BM-002, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of BM-002 BINDING SITE, designated SEQ ID:18724, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9946] Another function of VGAM125 is therefore inhibition of BM-002 (Accession NM_016617). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with BM-002. Chromosome 8 Open Reading Frame 4 (C8orf4, Accession NM_020130) is another VGAM125 host target gene. C8orf4 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by C8orf4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of C8orf4 BINDING SITE, designated SEQ ID:21325, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9947] Another function of VGAM125 is therefore inhibition of Chromosome 8 Open Reading Frame 4 (C8orf4, Accession NM_020130). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with C8orf4. CDW92 (Accession NM_080546) is another VGAM125 host target gene. CDW92 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by CDW92, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDW92 BINDING SITE, designated SEQ ID:27866, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9948] Another function of VGAM125 is therefore inhibition of CDW92 (Accession NM_080546). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CDW92. DKFZP564I1171 (Accession XM_049568) is another VGAM125 host target gene. DKFZP564I1171 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by DKFZP564I1171, correspond-

ing to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZP564I1171 BINDING SITE, designated SEQ ID:35445, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9949] Another function of VGAM125 is therefore inhibition of DKFZP564I1171 (Accession XM_049568). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZP564I1171. DKFZp761J1523 (Accession NM_032293) is another VGAM125 host target gene. DKFZp761J1523 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by DKFZp761J1523, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of DKFZp761J1523 BINDING SITE, designated SEQ ID:26061, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9950] Another function of VGAM125 is therefore inhibition of DKFZp761J1523 (Accession NM_032293). Accordingly,

utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with DKFZp761J1523. FLJ11155 (Accession NM_018342) is another VGAM125 host target gene. FLJ11155 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ11155, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ11155 BINDING SITE, designated SEQ ID:20347, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9951] Another function of VGAM125 is therefore inhibition of FLJ11155 (Accession NM_018342). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ11155. KIAA1237 (Accession XM_087386) is another VGAM125 host target gene. KIAA1237 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1237, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1237 BINDING SITE,

designated SEQ ID:39220, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9952] Another function of VGAM125 is therefore inhibition of KIAA1237 (Accession XM_087386). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1237. KIAA1376 (Accession XM_033042) is another VGAM125 host target gene. KIAA1376 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1376, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1376 BINDING SITE, designated SEQ ID:31821, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9953] Another function of VGAM125 is therefore inhibition of KIAA1376 (Accession XM_033042). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1376. KIAA1416 (Accession XM_098762) is another VGAM125 host target gene. KIAA1416 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1416, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1416 BINDING SITE, designated SEQ ID:41810, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9954] Another function of VGAM125 is therefore inhibition of KIAA1416 (Accession XM_098762). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1416. KIAA1913 (Accession XM_058167) is another VGAM125 host target gene. KIAA1913 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1913 BINDING SITE, designated SEQ ID:36576, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9955] Another function of VGAM125 is therefore inhibition of

KIAA1913 (Accession XM_058167). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1913. MGC19556 (Accession NM_033551) is another VGAM125 host target gene. MGC19556 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC19556, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC19556 BINDING SITE, designated SEQ ID:27317, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9956] Another function of VGAM125 is therefore inhibition of MGC19556 (Accession NM_033551). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC19556. MGC8407 (Accession NM_024046) is another VGAM125 host target gene. MGC8407 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC8407, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the

complementarity of the nucleotide sequences of MGC8407 BINDING SITE, designated SEQ ID:23479, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9957] Another function of VGAM125 is therefore inhibition of MGC8407 (Accession NM_024046). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC8407. MORF4 (Accession XM_165470) is another VGAM125 host target gene. MORF4 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by MORF4, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MORF4 BINDING SITE, designated SEQ ID:43643, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9958] Another function of VGAM125 is therefore inhibition of MORF4 (Accession XM_165470). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MORF4. Protein Phosphatase 1A (formerly 2C), Magnesium-depen-

dent, Alpha Isoform (PPM1A, Accession NM_021003) is another VGAM125 host target gene. PPM1A BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by PPM1A, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PPM1A BINDING SITE, designated SEQ ID:21997, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9959] Another function of VGAM125 is therefore inhibition of Protein Phosphatase 1A (formerly 2C), Magnesium-dependent, Alpha Isoform (PPM1A, Accession NM_021003). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PPM1A. PRO1430 (Accession NM_018599) is another VGAM125 host target gene. PRO1430 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by PRO1430, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of PRO1430 BINDING SITE, designated SEQ ID:20675, to the

nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9960] Another function of VGAM125 is therefore inhibition of PRO1430 (Accession NM_018599). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with PRO1430. LOC119369 (Accession XM_061434) is another VGAM125 host target gene. LOC119369 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC119369, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC119369 BINDING SITE, designated SEQ ID:37207, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9961] Another function of VGAM125 is therefore inhibition of LOC119369 (Accession XM_061434). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC119369. LOC126302 (Accession XM_059020) is another VGAM125 host target gene. LOC126302 BINDING SITE is HOST TARGET binding site found in the 3' un-

translated region of mRNA encoded by LOC126302, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC126302 BINDING SITE, designated SEQ ID:36824, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9962] Another function of VGAM125 is therefore inhibition of LOC126302 (Accession XM_059020). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC126302. LOC129676 (Accession XM_065341) is another VGAM125 host target gene. LOC129676 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC129676, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC129676 BINDING SITE, designated SEQ ID:37284, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9963] Another function of VGAM125 is therefore inhibition of LOC129676 (Accession XM_065341). Accordingly, utilities

of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC129676. LOC144667 (Accession XM_096648) is another VGAM125 host target gene. LOC144667 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144667, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144667 BINDING SITE, designated SEQ ID:40450, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9964] Another function of VGAM125 is therefore inhibition of LOC144667 (Accession XM_096648). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144667. LOC146756 (Accession XM_097085) is another VGAM125 host target gene. LOC146756 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC146756, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences

of LOC146756 BINDING SITE, designated SEQ ID:40739, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9965] Another function of VGAM125 is therefore inhibition of LOC146756 (Accession XM_097085). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC146756. LOC152275 (Accession XM_098186) is another VGAM125 host target gene. LOC152275 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC152275, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC152275 BINDING SITE, designated SEQ ID:41458, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9966] Another function of VGAM125 is therefore inhibition of LOC152275 (Accession XM_098186). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC152275. LOC162083 (Accession XM_091339) is another VGAM125 host target gene. LOC162083 BINDING

SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC162083, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC162083 BINDING SITE, designated SEQ ID:40047, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9967] Another function of VGAM125 is therefore inhibition of LOC162083 (Accession XM_091339). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC162083. LOC200982 (Accession XM_117305) is another VGAM125 host target gene. LOC200982 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC200982, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC200982 BINDING SITE, designated SEQ ID:43375, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9968] Another function of VGAM125 is therefore inhibition of

LOC200982 (Accession XM_117305). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC200982. LOC245728 (Accession XM_165922) is another VGAM125 host target gene. LOC245728 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC245728, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC245728 BINDING SITE, designated SEQ ID:43800, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9969] Another function of VGAM125 is therefore inhibition of LOC245728 (Accession XM_165922). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC245728. LOC254015 (Accession XM_172977) is another VGAM125 host target gene. LOC254015 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC254015, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 il-

illustrates the complementarity of the nucleotide sequences of LOC254015 BINDING SITE, designated SEQ ID:46246, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9970] Another function of VGAM125 is therefore inhibition of LOC254015 (Accession XM_172977). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254015. LOC257106 (Accession XM_170910) is another VGAM125 host target gene. LOC257106 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC257106, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC257106 BINDING SITE, designated SEQ ID:45678, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9971] Another function of VGAM125 is therefore inhibition of LOC257106 (Accession XM_170910). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC257106. LOC57109 (Accession NM_020385) is an-

other VGAM125 host target gene. LOC57109 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC57109, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC57109 BINDING SITE, designated SEQ ID:21656, to the nucleotide sequence of VGAM125 RNA, herein designated VGAM RNA, also designated SEQ ID:2836.

[9972] Another function of VGAM125 is therefore inhibition of LOC57109 (Accession NM_020385). Accordingly, utilities of VGAM125 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC57109. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 126 (VGAM126) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[9973] VGAM126 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM126 was detected is described

hereinabove with reference to Figs. 1–8.

[9974] VGAM126 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[9975] VGAM126 gene encodes a VGAM126 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM126 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM126 precursor RNA is designated SEQ ID:112, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:112 is located at position 47516 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[9976] VGAM126 precursor RNA folds onto itself, forming VGAM126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence

of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[9977] An enzyme complex designated DICER COMPLEX, `dices` the VGAM126 folded precursor RNA into VGAM126 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 40%) nucleotide sequence of VGAM126 RNA is designated SEQ ID:2837, and is provided hereinbelow with reference to the sequence listing part.

[9978] VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM126 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[9979] VGAM126 RNA, herein designated VGAM RNA, binds com-

plementarily to one or more host target binding sites located in untranslated regions of VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM126 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM126 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3'UTR region, this is meant as an example only – these host target binding sites may be located in the 3'UTR region, the 5'UTR region, or in both 3'UTR and 5'UTR regions.

[9980] The complementary binding of VGAM126 RNA, herein designated VGAM RNA, to host target binding sites on

VGAM126 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM126 host target RNA into VGAM126 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[9981] It is appreciated that VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM126 host target genes. The mRNA of each one of this plurality of VGAM126 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM126 RNA, herein designated VGAM RNA, and which when bound by VGAM126 RNA causes inhibition of translation of respective one or more VGAM126 host target proteins.

[9982] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM126 gene, herein designated VGAM GENE, on one or more VGAM126 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove

with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[9983] It is yet further appreciated that a function of VGAM126 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM126 correlate with, and may be deduced from, the identity of the host target genes which VGAM126 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[9984] Nucleotide sequences of the VGAM126 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the

`diced` VGAM126 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM126 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM126 are further described hereinbelow with reference to Table 1.

[9985] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM126 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM126 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[9986] As mentioned hereinabove with reference to Fig. 1, a function of VGAM126 gene, herein designated VGAM is inhibition of expression of VGAM126 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM126 correlate with, and may be deduced from, the identity of the target genes which VGAM126 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[9987] UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_006057) is a VGAM126 host target gene. B3GALT5 BINDING SITE1

through B3GALT5 BINDING SITE5 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by B3GALT5, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of B3GALT5 BINDING SITE1 through B3GALT5 BINDING SITE5, designated SEQ ID:12701, SEQ ID:27029, SEQ ID:27034, SEQ ID:27039 and SEQ ID:27024 respectively, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[9988] A function of VGAM126 is therefore inhibition of UDP-Gal:betaGlcNAc Beta 1,3-galactosyltransferase, Polypeptide 5 (B3GALT5, Accession NM_006057). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with B3GALT5. GATA Binding Protein 2 (GATA2, Accession NM_002050) is another VGAM126 host target gene. GATA2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by GATA2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide

sequences of GATA2 BINDING SITE, designated SEQ ID:7800, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[9989] Another function of VGAM126 is therefore inhibition of GATA Binding Protein 2 (GATA2, Accession NM_002050). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GATA2. Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949) is another VGAM126 host target gene. HAP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HAP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HAP1 BINDING SITE, designated SEQ ID:10072, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[9990] Another function of VGAM126 is therefore inhibition of Huntingtin-associated Protein 1 (neuroan 1) (HAP1, Accession NM_003949), a gene which functions as an adaptor protein using coiled coils to mediate interactions

among cytoskeletal, vascular, and motor proteins. Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HAP1. The function of HAP1 has been established by previous studies. Several neurodegenerative disorders are known to involve trinucleotide expansions of the CAG codon for glutamine, including Huntington disease (HD; 143100), spinocerebellar ataxia type 1 (OMIM Ref. No. 164400), Machado–Joseph disease (OMIM Ref. No. 109150), and spinobulbar muscular atrophy (313700.0014). Li et al. (1995) identified a cDNA for a rat brain protein that binds to the mutant HD protein by using the latter as bait in a 2–hybrid yeast screening assay. The protein, which they designated HAP1 (huntingtin–associated protein–1), was found to bind to huntingtin in proportion to the number of glutamines present in the glutamine repeat region. Two HAP1 cDNAs were found that differ at the C terminus, probably as a result of alternative splicing. The predicted 599– and 629–amino acid proteins are highly hydrophilic, rich in charged amino acids, and have no homology to known proteins. Two human PCR products, termed HAP1 and HLP (HAP–like protein), were obtained. The human HAP1 cDNA

encoded a protein 96% identical to the rat HAP1 protein. Northern blots showed a 4.0-kb HAP1 transcript in rat brains and RT-PCR demonstrated expression in human brain, especially in the caudate and cortex, regions affected in Huntington disease. Coimmunoprecipitation experiments with rat brain tissue and HAP1-transfected cells confirmed that HAP1 binds to huntingtin in vivo, though they had not yet clearly shown the same in human brain tissue. Li et al. (1995) speculated that the ability of HAP1 to bind to glutamine repeats in huntingtin is influenced by adjacent amino acids, since in their yeast 2-hybrid assays there was no binding of HAP1 to atrophin-1, even though their atrophin-1 construct contained essentially the same number of glutamine repeats (21) as did their huntingtin construct (23). Animal model experiments lend further support to the function of HAP1. Bertaux et al. (1998) cloned mouse Hap1 cDNA and demonstrated that expression is not enriched in areas specifically affected in Huntington disease. Bertaux et al. (1998) used the yeast 2-hybrid system to demonstrate that amino acids 171-230 of the huntingtin-associated protein are necessary for hap1-huntingtin binding and that Hap1 does not interact with the transgene exon 1 protein in a transgenic

model of HD.

- [9991] It is appreciated that the abovementioned animal model for HAP1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.
- [9992] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:
- [9993] Li, X.-J.; Li, S.-H.; Sharp, A. H.; Nucifora, F. C., Jr.; Schilling, G.; Lanahan, A.; Worley, P.; Snyder, S. H.; Ross, C. A. : A huntingtin-associated protein enriched in brain with implications for pathology. *Nature* 378: 398–402, 1995. ; and
- [9994] Bertaux, F.; Sharp, A. H.; Ross, C. A.; Lehrach, H.; Bates, G. P.; Wanker, E. : HAP1–huntingtin interactions do not contribute to the molecular pathology in Huntington's disease transgen.
- [9995] Further studies establishing the function and utilities of HAP1 are found in John Hopkins OMIM database record ID 600947, and in cited publications numbered 9614–9619 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 7

(KCNA7, Accession NM_031886) is another VGAM126 host target gene. KCNA7 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KCNA7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KCNA7 BINDING SITE, designated SEQ ID:25626, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[9996] Another function of VGAM126 is therefore inhibition of Potassium Voltage-gated Channel, Shaker-related Subfamily, Member 7 (KCNA7, Accession NM_031886), a gene which allows nerve cells to efficiently repolarize following an action potential. Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KCNA7. The function of KCNA7 has been established by previous studies. See 176260 for a general discussion of potassium voltage-gated ion channels. Using a probe from the mouse in the study of somatic cell hybrids, McPherson et al. (1991) found that a seventh member of the Shaker-related potassium voltage-gated channel is encoded by a gene on

chromosome 19. Kalman et al. (1998) reported the isolation of the mouse voltage-gated Shaker-related potassium channel gene, Kv1.7 (Kcna7). Unlike other known Kv1 family genes that have intronless coding regions, the protein-coding region of Kv1.7 was interrupted by a 1.9-kb intron. The gene was mapped to mouse chromosome 7 and human chromosome 19q13.3. The mouse Kv1.7 channel was voltage-dependent and exhibited cumulative inactivation. Northern blot analysis revealed transcripts of approximately 3 kb in mouse heart and skeletal muscle. Bardien-Kruger et al. (2002) deduced the coding region of KCNA7 by aligning the mouse cDNA sequence with a human BAC clone and mouse EST sequences. The region encodes a protein of 456 amino acid residues containing cytoplasmic N- and C-termini, a central core domain composed of 6 transmembrane segments and the characteristic pore-loop. The human intron was 1153 bp in length and smaller than that of mouse (1929 bp). Using the deduced amino acid sequences, the potassium-channels of the 2 species were highly conserved (greater than 95%). The expression of KCNA7 in human adult heart was confirmed by RT-PCR studies. Bardien-Kruger et al. (2002) refined the location of the KCNA7

gene within chromosome 19q13.3 by bioinformatic in silico mapping and implicated it as a positional candidate gene for progressive familial heart block type I (OMIM Ref. No. 604559), an autosomal dominant cardiac conduction disorder mapped to 19q13.3. In affected individuals, Bardien-Kruger et al. (2002) screened the coding region of KCNA7 by PCR-SSCP analysis and direct DNA sequencing, which did not reveal any pathogenic sequence changes

[9997] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[9998] Bardien-Kruger, S.; Wulff, H.; Arieff, Z.; Brink, P.; Chandy, K. G.; Corfield, V. : Characterisation of the human voltage-gated potassium channel gene, KCNA7, a candidate gene for inherited cardiac disorders, and its exclusion as cause of progressive familial heart block I (PFHBI). *Europ. J. Hum. Genet.* 10: 36-43, 2002. ; and

[10000] Further studies establishing the function and utilities of KCNA7 are found in John Hopkins OMIM database record

ID 176268, and in cited publications numbered 1094 and 10928 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Myosin ID (MYO1D, Accession XM_050041) is another VGAM126 host target gene. MYO1D BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MYO1D, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MYO1D BINDING SITE, designated SEQ ID:35547, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10001] Another function of VGAM126 is therefore inhibition of Myosin ID (MYO1D, Accession XM_050041), a gene which is an unconventional myosin. Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MYO1D. The function of MYO1D has been established by previous studies. Myosins are molecular motors that, upon interaction with actin filaments, utilize energy from ATP hydrolysis to generate mechanical force. For further background information on myosins, see MYO1A (OMIM Ref. No.

601478). By screening for cDNAs with the potential to encode large proteins expressed in brain, Nagase et al. (1998) identified a cDNA encoding MYO1D, which they called KIAA0727. The deduced 674-amino acid protein is 98% identical to rat Myr4. RT-PCR analysis detected expression of KIAA0727 in all tissues tested, with highest levels in brain, followed by lung and ovary; expression was lowest in spleen.

[10002] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10003] Hasson, T.; Skowron, J. F.; Gilbert, D. J.; Avraham, K. B.; Perry, W. L.; Bement, W. M.; Anderson, B. L.; Sherr, E. H.; Chen, Z.-Y.; Greene, L. A.; Ward, D. C.; Corey, D. P.; Mooseker, M. [10005] Further studies establishing the function and utilities of MYO1D are found in John Hopkins OMIM database record

ID 606539, and in cited publications numbered 702 and 7048 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference.ERG-1 (Accession NM_022034) is another VGAM126 host target gene. ERG-1 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by ERG-1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ERG-1 BINDING SITE, designated SEQ ID:22555, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10006] Another function of VGAM126 is therefore inhibition of ERG-1 (Accession NM_022034). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ERG-1. FLJ10748 (Accession NM_018203) is another VGAM126 host target gene. FLJ10748 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by FLJ10748, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity

of the nucleotide sequences of FLJ10748 BINDING SITE, designated SEQ ID:20084, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10007] Another function of VGAM126 is therefore inhibition of FLJ10748 (Accession NM_018203). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ10748. KIAA0319 (Accession NM_014809) is another VGAM126 host target gene. KIAA0319 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA0319, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA0319 BINDING SITE, designated SEQ ID:16757, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10008] Another function of VGAM126 is therefore inhibition of KIAA0319 (Accession NM_014809). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA0319. MGC2306 (Accession NM_032638) is another

VGAM126 host target gene. MGC2306 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2306, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2306 BINDING SITE, designated SEQ ID:26349, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10009] Another function of VGAM126 is therefore inhibition of MGC2306 (Accession NM_032638). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2306. MGC2705 (Accession NM_032701) is another VGAM126 host target gene. MGC2705 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by MGC2705, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MGC2705 BINDING SITE, designated SEQ ID:26416, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10010] Another function of VGAM126 is therefore inhibition of MGC2705 (Accession NM_032701). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MGC2705. X123 (Accession XM_046023) is another VGAM126 host target gene. X123 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by X123, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of X123 BINDING SITE, designated SEQ ID:34650, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10011] Another function of VGAM126 is therefore inhibition of X123 (Accession XM_046023). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with X123. LOC144453 (Accession XM_084869) is another VGAM126 host target gene. LOC144453 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by LOC144453, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE

II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC144453 BINDING SITE, designated SEQ ID:37744, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10012] Another function of VGAM126 is therefore inhibition of LOC144453 (Accession XM_084869). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC144453. LOC149670 (Accession XM_086647) is another VGAM126 host target gene. LOC149670 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC149670, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC149670 BINDING SITE, designated SEQ ID:38804, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10013] Another function of VGAM126 is therefore inhibition of LOC149670 (Accession XM_086647). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with

LOC149670. LOC157247 (Accession XM_088275) is another VGAM126 host target gene. LOC157247 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC157247, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC157247 BINDING SITE, designated SEQ ID:39575, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10014] Another function of VGAM126 is therefore inhibition of LOC157247 (Accession XM_088275). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC157247. LOC203197 (Accession XM_114645) is another VGAM126 host target gene. LOC203197 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC203197, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC203197 BINDING SITE, designated SEQ ID:43007, to the nucleotide sequence of VGAM126 RNA, herein desig-

nated VGAM RNA, also designated SEQ ID:2837.

[10015] Another function of VGAM126 is therefore inhibition of LOC203197 (Accession XM_114645). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC203197. LOC254559 (Accession XM_172931) is another VGAM126 host target gene. LOC254559 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC254559, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC254559 BINDING SITE, designated SEQ ID:46198, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10016] Another function of VGAM126 is therefore inhibition of LOC254559 (Accession XM_172931). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC254559. LOC92661 (Accession XM_046465) is another VGAM126 host target gene. LOC92661 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC92661, corre-

sponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC92661 BINDING SITE, designated SEQ ID:34721, to the nucleotide sequence of VGAM126 RNA, herein designated VGAM RNA, also designated SEQ ID:2837.

[10017] Another function of VGAM126 is therefore inhibition of LOC92661 (Accession XM_046465). Accordingly, utilities of VGAM126 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC92661. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 127 (VGAM127) viral gene, which modulates expression of respective host target genes thereof, the function and utility of which host target genes is known in the art.

[10018] VGAM127 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM127 was detected is described hereinabove with reference to Figs. 1–8.

[10019] VGAM127 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syn–

drome Virus (white spot bacilliform virus). VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10020] VGAM127 gene encodes a VGAM127 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM127 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM127 precursor RNA is designated SEQ ID:113, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:113 is located at position 126505 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10021] VGAM127 precursor RNA folds onto itself, forming VGAM127 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10022] An enzyme complex designated DICER COMPLEX, `dices` the VGAM127 folded precursor RNA into VGAM127 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 44%) nucleotide sequence of VGAM127 RNA is designated SEQ ID:2838, and is provided hereinbelow with reference to the sequence listing part.

[10023] VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM127 host target RNA comprises three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10024] VGAM127 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA. This

complementary binding is due to the fact that the nucleotide sequence of VGAM127 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM127 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10025] The complementary binding of VGAM127 RNA, herein designated VGAM RNA, to host target binding sites on VGAM127 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM127 host tar-

get RNA into VGAM127 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10026] It is appreciated that VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM127 host target genes. The mRNA of each one of this plurality of VGAM127 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM127 RNA, herein designated VGAM RNA, and which when bound by VGAM127 RNA causes inhibition of translation of respective one or more VGAM127 host target proteins.

[10027] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with specific reference to translational inhibition exerted by VGAM127 gene, herein designated VGAM GENE, on one or more VGAM127 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4

and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10028] It is yet further appreciated that a function of VGAM127 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM127 correlate with, and may be deduced from, the identity of the host target genes which VGAM127 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10029] Nucleotide sequences of the VGAM127 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM127 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM127 folded precursor RNA, herein designated

VGAM FOLDED PRECURSOR RNA, of VGAM127 are further described hereinbelow with reference to Table 1.

[10030] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM127 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM127 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10031] As mentioned hereinabove with reference to Fig. 1, a function of VGAM127 gene, herein designated VGAM is inhibition of expression of VGAM127 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM127 correlate with, and may be deduced from, the identity of the target genes which VGAM127 binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10032] Multiple Endocrine Neoplasia I (MEN1, Accession NM_130803) is a VGAM127 host target gene. MEN1 BINDING SITE1 and MEN1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MEN1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING

SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MEN1 BINDING SITE1 and MEN1 BINDING SITE2, designated SEQ ID:28299 and SEQ ID:28303 respectively, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10033] A function of VGAM127 is therefore inhibition of Multiple Endocrine Neoplasia I (MEN1, Accession NM_130803). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MEN1. SMP1 (Accession NM_014313) is another VGAM127 host target gene. SMP1 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by SMP1, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of SMP1 BINDING SITE, designated SEQ ID:15611, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10034] Another function of VGAM127 is therefore inhibition of SMP1 (Accession NM_014313), a gene which is a potential integral membrane protein. Accordingly, utilities of

VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with SMP1. The function of SMP1 has been established by previous studies. Wagner and Flegel (2000) found that the RH cluster on chromosome 1p contains 3 genes: RHD (OMIM Ref. No. 111680), RHCE (OMIM Ref. No. 111700), and SMP1. They noted that the nucleotide sequence of SMP1 had been deposited in GenBank (AF091282) as encoding a putative 157-amino acid member of an 18-kD small membrane protein family and that the gene shows homology to an open reading frame on chromosome 21 (Reboul et al., 1999). The position of the gene between both RH genes implies that any polymorphism of the SMP1 gene would be tightly linked to a specific RH haplotype. The authors suggested that functionally relevant mutations of the SMP1 gene may cause selection pressure for or against specific RH haplotypes. Such factors might explain some previously unresolved issues of RH haplotype distribution, such as the high frequency of RH-negativity in the European population.

[10035] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10036] Reboul, J.; Gardiner, K.; Monneron, D.; Uze, G.; Lutfalla, G. : Comparative genomic analysis of the interferon/interleukin-10 receptor gene cluster. *Genome Res.* 9: 242-250, 1999. ; and
- [10037] Wagner, F. F.; Flegel, W. A. : RHD gene deletion occurred in the Rhesus box. *Blood* 95: 3662-3668, 2000.
- [10038] Further studies establishing the function and utilities of SMP1 are found in John Hopkins OMIM database record ID 605348, and in cited publications numbered 6179 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Xylulokinase Homolog (*H. influenzae*) (XYLB, Accession NM_005108) is another VGAM127 host target gene. XYLB BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by XYLB, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of XYLB BINDING SITE, designated SEQ ID:11583, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.
- [10039] Another function of VGAM127 is therefore inhibition of Xylulokinase Homolog (*H. influenzae*) (XYLB, Accession

NM_005108), a gene which is similar to *Haemophilus influenzae* xylulokinase and may play a role in energy metabolism. Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with XYLB. The function of XYLB has been established by previous studies. The 3p22–p21.3 chromosomal region is one of 3 regions of 3p that is commonly deleted in various carcinomas. By analysis of a cloned segment from this region, Tamari et al. (1998) identified a novel gene, which they designated XYLB because the predicted 528–amino acid protein shares 22% identity with *Haemophilus influenzae* xylulokinase (Xyl). The XYLB gene contains 18 exons and spans approximately 28 kb. Northern blot analysis revealed that XYLB was expressed as a 2.3–kb major transcript in all tissues tested. A less abundant 1.8–kb mRNA was detected in heart and skeletal muscle. Daigo et al. (1999) reported that the XYLB gene is located between the OCTL2 (OMIM Ref. No. 604048) and ActRIIB (OMIM Ref. No. 602730) genes on 3p22–p21.3.

[10040] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

- [10041] Daigo, Y.; Isomura, M.; Nishiwaki, T.; Tamari, M.; Ishikawa, S.; Kai, M.; Murata, Y.; Takeuchi, K.; Yamane, Y.; Hayashi, R.; Minami, M.; Fujino, M. A.; Hojo, Y.; Uchiyama, I.; Takagi, T.; Nakamura, Y. : Characterization of a 1200-kb genomic segment of chromosome 3p22–p21.3. DNA Res. 6: 37–44, 1999. ; and
- [10042] Tamari, M.; Daigo, Y.; Ishikawa, S.; Nakamura, Y. : Genomic structure of a novel human gene (XYLB) on chromosome 3p22–p21.3 encoding a xylulokinase–like protein. Cytogenet. Cell Genet.
- [10043] Further studies establishing the function and utilities of XYLB are found in John Hopkins OMIM database record ID 604049, and in cited publications numbered 9037 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Heterogeneous Nuclear Ribonucleoprotein C (C1/C2) (HNRPC, Accession NM_031314) is another VGAM127 host target gene. HNRPC BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by HNRPC, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of HNRPC BINDING SITE, designated SEQ

ID:25350, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10044] Another function of VGAM127 is therefore inhibition of Heterogeneous Nuclear Ribonucleoprotein C (C1/C2) (HNRPC, Accession NM_031314). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with HNRPC. KIAA1364 (Accession XM_032997) is another VGAM127 host target gene. KIAA1364 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1364, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1364 BINDING SITE, designated SEQ ID:31815, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10045] Another function of VGAM127 is therefore inhibition of KIAA1364 (Accession XM_032997). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1364. KR18 (Accession NM_033288) is another

VGAM127 host target gene. KR18 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KR18, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KR18 BINDING SITE, designated SEQ ID:27122, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10046] Another function of VGAM127 is therefore inhibition of KR18 (Accession NM_033288). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KR18. LOC221103 (Accession XM_167758) is another VGAM127 host target gene. LOC221103 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by LOC221103, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC221103 BINDING SITE, designated SEQ ID:44777, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10047] Another function of VGAM127 is therefore inhibition of LOC221103 (Accession XM_167758). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC221103. LOC90333 (Accession XM_030958) is another VGAM127 host target gene. LOC90333 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by LOC90333, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of LOC90333 BINDING SITE, designated SEQ ID:31228, to the nucleotide sequence of VGAM127 RNA, herein designated VGAM RNA, also designated SEQ ID:2838.

[10048] Another function of VGAM127 is therefore inhibition of LOC90333 (Accession XM_030958). Accordingly, utilities of VGAM127 include diagnosis, prevention and treatment of diseases and clinical conditions associated with LOC90333. Fig. 1 further provides a conceptual description of a novel bioinformatically detected viral gene of the present invention, referred to here as Viral Genomic Address Messenger 128 (VGAM128) viral gene, which modulates expression of respective host target genes thereof,

the function and utility of which host target genes is known in the art.

[10049] VGAM128 is a novel bioinformatically detected regulatory, non protein coding, viral micro RNA (miRNA) gene. The method by which VGAM128 was detected is described hereinabove with reference to Figs. 1–8.

[10050] VGAM128 gene, herein designated VGAM GENE, is a viral gene contained in the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus). VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, is a human gene contained in the human genome.

[10051] VGAM128 gene encodes a VGAM128 precursor RNA, herein designated VGAM PRECURSOR RNA. Similar to other miRNA genes, and unlike most ordinary genes, VGAM128 precursor RNA does not encode a protein. A nucleotide sequence identical or highly similar to the nucleotide sequence of VGAM128 precursor RNA is designated SEQ ID:114, and is provided hereinbelow with reference to the sequence listing part. Nucleotide sequence SEQ ID:114 is located at position 46000 relative to the genome of Shrimp White Spot Syndrome Virus (white spot bacilliform virus).

[10052] VGAM128 precursor RNA folds onto itself, forming

VGAM128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, which has a two-dimensional `hairpin structure`. As is well known in the art, this `hairpin structure`, is typical of RNA encoded by miRNA genes, and is due to the fact that the nucleotide sequence of the first half of the RNA encoded by a miRNA gene is an accurate or partial inversed-reversed sequence of the nucleotide sequence of the second half thereof.

[10053] An enzyme complex designated DICER COMPLEX, `dices` the VGAM128 folded precursor RNA into VGAM128 RNA, herein designated VGAM RNA, a single stranded ~22 nt long RNA segment. As is known in the art, `dicing` of a hairpin structured RNA precursor product into a short ~22nt RNA segment is catalyzed by an enzyme complex comprising an enzyme called Dicer together with other necessary proteins. A probable (over 41%) nucleotide sequence of VGAM128 RNA is designated SEQ ID:2839, and is provided hereinbelow with reference to the sequence listing part.

[10054] VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, encodes a corresponding messenger RNA, VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. VGAM128 host target RNA comprises

three regions, as is typical of mRNA of a protein coding gene: a 5` untranslated region, a protein coding region and a 3` untranslated region, designated 5`UTR, PROTEIN CODING and 3`UTR respectively.

[10055] VGAM128 RNA, herein designated VGAM RNA, binds complementarily to one or more host target binding sites located in untranslated regions of VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. This complementary binding is due to the fact that the nucleotide sequence of VGAM128 RNA is an accurate or a partial inversed-reversed sequence of the nucleotide sequence of each of the host target binding sites. As an illustration, Fig. 1 shows three such host target binding sites, designated BINDING SITE I, BINDING SITE II and BINDING SITE III respectively. It is appreciated that the number of host target binding sites shown in Fig. 1 is meant as an illustration only, and is not meant to be limiting – VGAM128 RNA, herein designated VGAM RNA, may have a different number of host target binding sites in untranslated regions of a VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA. It is further appreciated that while Fig. 1 depicts host target binding sites in the 3`UTR region, this is meant as an example

only – these host target binding sites may be located in the 3`UTR region, the 5`UTR region, or in both 3`UTR and 5`UTR regions.

[10056] The complementary binding of VGAM128 RNA, herein designated VGAM RNA, to host target binding sites on VGAM128 host target RNA, herein designated VGAM HOST TARGET RNA, such as BINDING SITE I, BINDING SITE II and BINDING SITE III, inhibits translation of VGAM128 host target RNA into VGAM128 host target protein, herein designated VGAM HOST TARGET PROTEIN. VGAM host target protein is therefore outlined by a broken line.

[10057] It is appreciated that VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, in fact represents a plurality of VGAM128 host target genes. The mRNA of each one of this plurality of VGAM128 host target genes comprises one or more host target binding sites, each having a nucleotide sequence which is at least partly complementary to VGAM128 RNA, herein designated VGAM RNA, and which when bound by VGAM128 RNA causes inhibition of translation of respective one or more VGAM128 host target proteins.

[10058] It is further appreciated by one skilled in the art that the mode of translational inhibition illustrated by Fig. 1 with

specific reference to translational inhibition exerted by VGAM128 gene, herein designated VGAM GENE, on one or more VGAM128 host target gene, herein designated VGAM HOST TARGET GENE, is in fact common to other known non-viral miRNA genes. As mentioned hereinabove with reference to the background section, although a specific complementary binding site has been demonstrated only for some of the known miRNA genes (primarily Lin-4 and Let-7), all other recently discovered miRNA genes are also believed by those skilled in the art to modulate expression of other genes by complementary binding, although specific complementary binding sites of these other miRNA genes have not yet been found (Ruvkun G., `Perspective: Glimpses of a tiny RNA world`, Science 294,779 (2001)).

[10059] It is yet further appreciated that a function of VGAM128 is inhibition of expression of host target genes, as part of a novel viral mechanism of attacking a host. Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of viral infection by Shrimp White Spot Syndrome Virus (white spot bacilliform virus). Specific functions, and accordingly utilities, of VGAM128 correlate with, and may be deduced from, the identity of the host

target genes which VGAM128 binds and inhibits, and the function of these host target genes, as elaborated hereinbelow.

[10060] Nucleotide sequences of the VGAM128 precursor RNA, herein designated VGAM PRECURSOR RNA, and of the `diced` VGAM128 RNA, herein designated VGAM RNA, and a schematic representation of the secondary folding of VGAM128 folded precursor RNA, herein designated VGAM FOLDED PRECURSOR RNA, of VGAM128 are further described hereinbelow with reference to Table 1.

[10061] Nucleotide sequences of host target binding sites, such as BINDING SITE-I, BINDING SITE-II and BINDING SITE-III of Fig. 1, found on VGAM128 host target RNA, and schematic representation of the complementarity of each of these host target binding sites to VGAM128 RNA, herein designated VGAM RNA, are described hereinbelow with reference to Table 2.

[10062] As mentioned hereinabove with reference to Fig. 1, a function of VGAM128 gene, herein designated VGAM is inhibition of expression of VGAM128 target genes. It is appreciated that specific functions, and accordingly utilities, of VGAM128 correlate with, and may be deduced from, the identity of the target genes which VGAM128

binds and inhibits, and the function of these target genes, as elaborated hereinbelow.

[10063] Cyclin D2 (CCND2, Accession NM_001759) is a VGAM128 host target gene. CCND2 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by CCND2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CCND2 BINDING SITE, designated SEQ ID:7520, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10064] A function of VGAM128 is therefore inhibition of Cyclin D2 (CCND2, Accession NM_001759), a gene which is essential for the control of the cell cycle at the G1/s (start) transition. Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with CCND2. The function of CCND2 has been established by previous studies. Inaba et al. (1992) used murine cDNA clones for 3 cyclin D genes that are normally expressed during the G1 phase of the cell cycle to clone the cognate human genes. By analysis of somatic cell hybrids containing different human chro-

mosomes and by fluorescence in situ hybridization, they assigned the gene for cyclin D2 (CCND2) to 12p13. (Since the CCND1 gene (OMIM Ref. No. 168461) is on 11q13, this may be another bit of evidence of the homology of chromosomes 11 and 12.) Xiong et al. (1992) reported the cloning of the CCND2 gene and its assignment to 12p13 by fluorescence in situ hybridization. A pseudogene of CCND2 was mapped to 11q13 by Inaba et al. (1992). Kim et al. (2000) used Ccnd1- and Ccnd2-deficient mice to investigate the role of cyclins in Schwann cell growth. They concluded that neither Ccnd1 nor Ccnd2 is specifically required for the initial growth and maturation of Schwann cells during mouse development (see OMIM Ref. No. CCND1; 168461).

[10065] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10066] Inaba, T.; Matsushime, H.; Valentine, M.; Roussel, M. F.; Sherr, C. J.; Look, A. T. : Genomic organization, chromosomal localization, and independent expression of human cyclin D genes. *Genomics* 13: 565–574, 1992. ; and

[10067] Kim, H. A.; Pomeroy, S. L.; Whoriskey, W.; Pawlitzky, I.; Benowitz, L. I.; Sicinski, P.; Stiles, C. D.; Roberts, T. M. : A

developmentally regulated switch directs regenerative growth o.

[10068] Further studies establishing the function and utilities of CCND2 are found in John Hopkins OMIM database record ID 123833, and in cited publications numbered 4343–4345 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. Cerebellar Degeneration–related Protein 2, 62kDa (CDR2, Accession XM_071866) is another VGAM128 host target gene. CDR2 BINDING SITE is HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by CDR2, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of CDR2 BINDING SITE, designated SEQ ID:37427, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10069] Another function of VGAM128 is therefore inhibition of Cerebellar Degeneration–related Protein 2, 62kDa (CDR2, Accession XM_071866), a gene which plays a role in cytokinesis, cell shape, and functions such as secretion and capping. Accordingly, utilities of VGAM128 include diag–

nosis, prevention and treatment of diseases and clinical conditions associated with CDR2. The function of CDR2 has been established by previous studies. Paraneoplastic cerebellar degeneration is an autoimmune disorder associated with neoplasms of lung, ovary, breast, or Hodgkin disease. Patients with paraneoplastic cerebellar degeneration carry a characteristic antibody called anti-Yo. On Western blot analysis of Purkinje cells and tumor tissue, the anti-Yo sera react with at least 2 antigens, a major species of 62 kD called CDR62 and a minor species of 34 kD called CDR34, where CDR means cerebellar degeneration-related. CDR34 is encoded by a gene on the X chromosome (CDR1; 302650). Furneaux et al. (1990) cloned and characterized the gene encoding CDR62, a leucine-zipper DNA-binding protein; see Fathallah-Shaykh et al. (1991). By a combination of study of rodent/human somatic cell hybrids and in situ hybridization, Gress et al. (1991, 1992) assigned the CDR2 gene to 16p13.1-p12. The gene is positioned in an interval that contains 2 rare heritable fragile sites. Fletcher et al. (1997) determined the mouse chromosomal locations of 9 genes that encode 'onconeural antigens,' i.e., antigens that are expressed by systemic tumors and elicit an immune response that

may develop into an autoimmune neuronal degeneration. One of these genes was the Cdr2 gene, which they mapped to mouse chromosome 7 in a region of homology to 16p13.1–p12.

[10070] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10071] Fathallah–Shaykh, H.; Wolf, S.; Wong, E.; Posner, J. B. : Cloning of a leucine–zipper protein recognized by the sera of patients with antibody–associated paraneoplastic cerebellar degeneration. Proc. Nat. Acad. Sci. 88: 3451–3454, 1991. ; and

[10072] Furneaux, H. M.; Rosenblum, M. K.; Dalmau, J.; Wong, E.; Woodruff, P.; Graus, F.; Posner, J. B. : Selective expression of Purkinje–cell antigens in tumor tissue from patients with parane.

[10073] Further studies establishing the function and utilities of CDR2 are found in John Hopkins OMIM database record ID 117340, and in cited publications numbered 12686, 10638–1063 and 12687–12688 listed in the bibliography section hereinbelow, which are also hereby incorporated by reference. MAX Interacting Protein 1 (MXI1, Accession NM_005962) is another VGAM128 host target gene. MXI1

BINDING SITE1 and MXI1 BINDING SITE2 are HOST TARGET binding sites found in untranslated regions of mRNA encoded by MXI1, corresponding to HOST TARGET binding sites such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MXI1 BINDING SITE1 and MXI1 BINDING SITE2, designated SEQ ID:12586 and SEQ ID:28196 respectively, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10074] Another function of VGAM128 is therefore inhibition of MAX Interacting Protein 1 (MXI1, Accession NM_005962), a gene which acts as a tumor suppressor in vivo, engages the MYC network in a functionally relevant manner. Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MXI1. The function of MXI1 has been established by previous studies. One of the most common chromosomal abnormalities in prostate cancer involves loss of 10q22-qter. Rarely, a smaller deletion, involving 10q24-q25 has been observed, suggesting the presence of a tumor suppressor gene at that site. Prochownik et al. (1998) prospectively evaluated prostate tumors for loss of

MXI1 by FISH and cytogenetic techniques. Of 40 tumors, 21 (53%) demonstrated loss of a single MXI1 allele, as determined by FISH. In 10 cases with cytogenetically normal long arms of chromosome 10, but with FISH–documented deletion of MXI1, 8 mutations of MXI1 were identified. Five of the mutant proteins were incapable of binding DNA in association with MAX. Prochownik et al. (1998) concluded that MXI1 gene loss in prostate cancer is common and most frequently involves a cytogenetically undetectable deletion. Animal model experiments lend further support to the function of MXI1. MXI1 belongs to the family of proteins that function as potent antagonists of MYC oncoproteins. This antagonism relates to their ability to compete with MYC for the protein MAX and for consensus DNA binding sites and to recruit Sin3 proteins and their associated corepressors. Schreiber–Agus et al. (1998) disrupted the Mxi1 open reading frame in transgenic mice by eliminating an exon required for the production of the 2 mouse Mxi1 isoforms. They showed that the mice lacking Mxi1 exhibit progressive multisystem abnormalities. The mice also showed increased susceptibility to tumorigenesis either following carcinogen treatment or when also deficient in INK4A (OMIM Ref. No. 600160). This cancer–

prone phenotype may correspond with the enhanced ability of several MXI1-deficient cell types, including prostatic epithelium, to proliferate. The results show that MXI1 is involved in the homeostasis of differentiated organ systems, acts as a tumor suppressor in vivo, and engages the MYC network in a functionally relevant manner. In histologic studies of the mice, Schreiber-Agus et al. (1998) focused particularly on organs that normally express high or sustained levels of Mxi1, e.g., brain, spleen, kidney, and liver, and on tissue types that are susceptible to tumorigenesis when a putative tumor suppressor is lost from the 10q24-q26 region; for example, the spleen and thymus are susceptible to T-cell leukemia, the prostatic epithelium to prostate cancer, and the brain to glioblastoma multiforme when the 10q24-q26 region is mutated.

[10075] It is appreciated that the abovementioned animal model for MXI1 is acknowledged by those skilled in the art as a scientifically valid animal model, as can be further appreciated from the publications cited hereinbelow.

[10076] Full details of the abovementioned studies are described in the following publications, the disclosure of which are hereby incorporated by reference:

[10077] Prochownik, E. V.; Grove, L. E.; Deubler, D.; Zhu, X. L.;

the regulation of.

[10079] Further studies establishing the function and utilities of
MXI1 are found in John Hopkins OMIM database record ID
600020, and in cited publications numbered 8791, 8230,
8326–832 and 12617–8332 listed in the bibliography
section hereinbelow, which are also hereby incorporated
by reference. Stauf, RNA Binding Protein, Homolog 2
(Drosophila) (STAU2, Accession NM_014393) is another
VGAM128 host target gene. STAU2 BINDING SITE is HOST
TARGET binding site found in the 3` untranslated region
of mRNA encoded by STAU2, corresponding to a HOST
TARGET binding site such as BINDING SITE I, BINDING SITE
II or BINDING SITE III. Table 2 illustrates the complemen-
tarity of the nucleotide sequences of STAU2 BINDING SITE,
designated SEQ ID:15721, to the nucleotide sequence of
VGAM128 RNA, herein designated VGAM RNA, also desig-

nated SEQ ID:2839.

[10080] Another function of VGAM128 is therefore inhibition of Staufen, RNA Binding Protein, Homolog 2 (Drosophila) (STAU2, Accession NM_014393). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with STAU2. ALDH9 (Accession NM_000696) is another VGAM128 host target gene. ALDH9 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by ALDH9, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of ALDH9 BINDING SITE, designated SEQ ID:6361, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10081] Another function of VGAM128 is therefore inhibition of ALDH9 (Accession NM_000696). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with ALDH9. FKSG44 (Accession NM_031904) is another VGAM128 host target gene. FKSG44 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA en-

coded by FKSG44, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FKSG44 BINDING SITE, designated SEQ ID:25649, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10082] Another function of VGAM128 is therefore inhibition of FKSG44 (Accession NM_031904). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FKSG44. FLJ20232 (Accession NM_019008) is another VGAM128 host target gene. FLJ20232 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by FLJ20232, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of FLJ20232 BINDING SITE, designated SEQ ID:21086, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10083] Another function of VGAM128 is therefore inhibition of FLJ20232 (Accession NM_019008). Accordingly, utilities of

VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with FLJ20232. GAPCENA (Accession NM_012197) is another VGAM128 host target gene. GAPCENA BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by GAPCENA, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of GAPCENA BINDING SITE, designated SEQ ID:14492, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10084] Another function of VGAM128 is therefore inhibition of GAPCENA (Accession NM_012197). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with GAPCENA. KIAA1040 (Accession XM_051091) is another VGAM128 host target gene. KIAA1040 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by KIAA1040, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1040 BINDING SITE,

designated SEQ ID:35737, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10085] Another function of VGAM128 is therefore inhibition of KIAA1040 (Accession XM_051091). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1040. KIAA1165 (Accession XM_041162) is another VGAM128 host target gene. KIAA1165 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by KIAA1165, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1165 BINDING SITE, designated SEQ ID:33473, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10086] Another function of VGAM128 is therefore inhibition of KIAA1165 (Accession XM_041162). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1165. KIAA1913 (Accession XM_058167) is another VGAM128 host target gene. KIAA1913 BINDING SITE is

HOST TARGET binding site found in the 5` untranslated region of mRNA encoded by KIAA1913, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of KIAA1913 BINDING SITE, designated SEQ ID:36577, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10087] Another function of VGAM128 is therefore inhibition of KIAA1913 (Accession XM_058167). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with KIAA1913. Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622) is another VGAM128 host target gene. MRPL35 BINDING SITE is HOST TARGET binding site found in the 3` untranslated region of mRNA encoded by MRPL35, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of MRPL35 BINDING SITE, designated SEQ ID:18738, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10088] Another function of VGAM128 is therefore inhibition of Mitochondrial Ribosomal Protein L35 (MRPL35, Accession NM_016622). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with MRPL35. Oxysterol Binding Protein-like 7 (OSBPL7, Accession NM_017731) is another VGAM128 host target gene. OSBPL7 BINDING SITE is HOST TARGET binding site found in the 5' untranslated region of mRNA encoded by OSBPL7, corresponding to a HOST TARGET binding site such as BINDING SITE I, BINDING SITE II or BINDING SITE III. Table 2 illustrates the complementarity of the nucleotide sequences of OSBPL7 BINDING SITE, designated SEQ ID:19318, to the nucleotide sequence of VGAM128 RNA, herein designated VGAM RNA, also designated SEQ ID:2839.

[10089] Another function of VGAM128 is therefore inhibition of Oxysterol Binding Protein-like 7 (OSBPL7, Accession NM_017731). Accordingly, utilities of VGAM128 include diagnosis, prevention and treatment of diseases and clinical conditions associated with OSBPL7. Septin 3 (SEPT3, Accession NM_019106) is another VGAM128 host target gene. SEPT3 BINDING SITE is HOST TARGET binding site found in the 3' untranslated region of mRNA encoded by
